Chapter 24: EVOLUTION

INTRODUCTION

THIS chapter belongs to Darwin. Not that his writings, which are cited under almost all headings, stand alone in the various places they appear. The point is rather that many of the topics are dictated by and draw their meaning from his thought, and that he figures in all the major issues connected with the origin of species, the theory of evolution, and the place of man in the order of nature. With respect to the matters under consideration in this chapter, the other writers in the tradition of the great books cannot escape from being classified as coming before or after Darwin, or as being with or against him.

Darwin's influence on later writers may be variously estimated, but it is plainly marked by their use of his language and their reference to his fundamental notions. James' *Principles of Psychology*, especially in its chapters on instinct and emotion, views the behavior of men and animals and the phenomena of intelligence or mind in evolutionary terms. The writings of Freud are similarly dominated by the genetic approach and by an appeal to man's animal ancestry in order to explain the inherited constitution of his psyche in conformity with the doctrine of evolution.

Outside psychology the concept of evolution is reflected in theories of progress or of a dialectical development in history; as, for example, in the dialectical or historical materialism of Marx and Engels, which is set forth in the latter's *Dialectics of Nature*. An even more general re-orientation of philosophy, which stems from an evolutionary way of thinking, is to be found in the writings of Bergson and Dewey, such as *Creative Evolution* and *The Influence of Darwin on Philosophy*. These, along with many of the specifically biological works cited in the list of Additional Readings, give some measure of the influence of Darwin not

only on philosophical thought, but also on the direction of research in all the biological sciences.

WITH REGARD TO Darwin's predecessors the question is not so much one of their influence upon him as of their anticipation, in one way or another, of his discoveries, his conceptions, and his theory.

The observation made in antiquity concerning a hillside deposit of marine fossils is sometimes taken as implying an early recognition of the evolution of terrestrial life. More apposite perhaps is the statement by Lucretius that "the new earth first put forth grass and bushes, and next gave birth to the races of mortal creatures springing up many in number in many ways after divers fashions." Lucretius also speaks of strange monsters which nature did not permit to survive. "Nature set a ban on their increase and they could not reach the coveted flower of age nor find food nor be united in marriage . . . And many races of living things must then have died out and been unable to beget and continue their breed." Those which survived, he adds, had qualities which "protected and preserved each particular race."

Apparently susceptible to similar interpretation are Aristotle's statements that "nature proceeds little by little from things lifeless to animal life"; that "there is observed in plants a continuous scale of ascent toward the animal"; and that "throughout the entire animal scale there is a graduated differentiation in amount of vitality and in capacity for motion." Augustine's commentary on the first chapter of Genesis seems even more explicitly to contemplate the successive appearance of the various forms of life. Plants and animals did not actually exist when the world began. Though their causes were created by God and existed from the beginning, the actual production of plants

and animals in their various kinds is, as Aquinas tells us while summarizing Augustine's view, "the work of propagation"—not of creation.

Like Aristotle, both Aquinas and Locke represent the world of living organisms as a graduated scale ascending from less to more perfect forms of life. But where Aquinas tends to conceive that graduated scale as a hierarchy involving essential differences, Locke sees an almost perfect continuity involving only differences in degree. "In all the visible world," he writes, "we see no chasms or gaps." To illustrate this, he points out that "there are fishes that have wings, and are not strangers to the airy region; and there are some birds that are inhabitants of the water, whose blood is cold as fishes . . . There are animals so near of kin to both birds and beasts that they are in the middle between both: amphibious animals link the terrestrial and aquatic together . . . and the animal and vegetable kingdoms are so nearly joined, that, if you will take the lowest of one and the highest of the other, there will scarce be perceived any great difference between them: and so on, till we come to the lowest and the most inorganic parts of matter, we shall find everywhere that the several species are linked together, and differ but in almost insensible degrees."

But for the theory of evolution the observation of a hierarchy in nature, or even of a continuity in which the species differ by "almost insensible degrees," constitutes only background. What the theory of evolution brings to the fore is the notion of a developmental or genetic relation among the various forms of life. Because it seems to contain this insight, the anticipation of Darwin to be found in Kant's *Critique of Judgement* is perhaps the most remarkable; even though, in a closely related passage in which Kant discusses epigenesis, he uses the word "evolution" in a sense quite contrary to Darwin's conception.

"It is praiseworthy," Kant writes, "to employ a comparative anatomy and go through the vast creation of organized beings in order to see if there is not discoverable in it some trace of a system, and indeed of a system following a genetic principle . . . When we consider the agreement of so many genera of animals in a certain common schema, which apparently underlies not only the structure of their bones,

but also the disposition of their remaining parts, and when we find here the wonderful simplicity of the original plan, which has been able to produce such an immense variety of species by the shortening of one member and the lengthening of another, by the involution of this part and the evolution of that, there gleams upon the mind a ray of hope, however faint, that the principle of the mechanism of nature, apart from which there can be no natural science at all, may yet enable us to arrive at some explanation in the case of organic life. This analogy of forms, which in all their differences seem to be produced in accordance with a common type, strengthens the suspicion that they have an actual kinship due to descent from a common parent. This we might trace in the gradual approximation of one animal species to another, from that in which the principle of ends seems best authenticated, namely from man, back to the polyp, and from this back even to mosses and lichens, and finally to the lowest perceivable stage of nature."

FINDING ANTICIPATIONS of Darwin involves judgments much more subject to controversy than tracing his influences. It is questionable, for example, whether the suggestive passages in Lucretius and Locke bear more than a superficial resemblance to Darwin's thought. The matter is further complicated by Darwin's own sense of his divergence from and disagreement with his predecessors—both immediate precursors like Buffon and Linnaeus and earlier philosophers and theologians.

Darwin tells us himself of his quarrel with the theologians. His followers elaborate on the opposition between his conception of species and that of Aristotle, an opposition which Darwin intimates by the great stress he lays on the difference between a static taxonomy and a dynamic or genealogical classification of living things.

We must therefore try to locate the central points of Darwin's theory in order to judge comparable views for their agreement or disagreement.

As the title of his major work indicates, it is not evolution as a grand scheme of biological, or cosmic, history, but the origin of species with which Darwin seems to be principally con-

cerned. He is concerned with establishing the fact that new species do originate in the course of time, against those who suppose the species of living things to be fixed in number and immutable in type throughout the ages. He is concerned with describing the circumstances under which new species arise and other forms cease to have the status of species or become extinct. He is concerned with formulating the various factors in the differentiation of species, and with showing, against those who think a new species requires a special act of creation, that the origin of species, like their extinction, is entirely a natural process which requires no factors other than those at work every day in the life, death, and breeding of plants and animals. Only as a consequence of these primary considerations does he engage in speculations about the moving panorama of life on earth from its beginnings to its present and its future.

Darwin looks upon the term "species" as "arbitrarily given," and for that reason does not attempt any strict definition of it. He uses it, moreover, like his predecessors in systematic biological classification, to signify "a set of individuals closely resembling each other"—a class of plants or animals having certain common characteristics. Darwin would probably agree with Locke's criticism of those who suppose that our definitions of species grasp the real essences or relate to the substantial forms inherent in things. As indicated in the chapter on DEFINITION, Locke insists that our notion of a species expresses only what he calls the "nominal essence"—a set of characteristics we attach to the name we give things of a sort when we group them and separate them in our classifications. "The boundaries of species, whereby man sorts [things], are made by men," he writes; "the essences of the species, distinguished by different names, are . . . of man's making."

Species is not the only term of classification. A *genus*, for example, is a more inclusive group than a *species*. Groups which differ specifically belong to the same genus if their difference is accompanied by the possession of common traits. As species differ from one another within a generic group, so genera are in turn sub-classes of more inclusive groupings, such as

phyla, families, and orders. But there are also smaller groupings within a species. There are races or varieties and sub-varieties, the members of which share the characteristics of the species but differ from one another in other respects. Ultimately, of course, within the smallest class the systematist bothers to define, each individual differs from every other in the same group with whom, at the same time, it shares certain characteristics of the race, the species, the genus, and all the larger classes to which they belong.

This general plan of botanical or zoological classification does not seem to give *species* peculiar status in the hierarchy of classes or groupings or to distinguish it from other classes except as these are more or less inclusive than itself. Why then should attention be focused on the origin of species, rather than of varieties or of genera?

One part of the answer comes from the facts of generation or reproduction. Offspring tend to differ from their parents, as well as from each other, but they also tend to resemble one another. "A given germ," Aristotle writes, "does not give rise to any chance living being, nor spring from any chance one; but each germ springs from a definite parent and gives rise to a definite progeny." This is an early formulation of the insight that in the process of reproduction, the law of like generating like always holds for those characteristics which identify the species of ancestors and progeny.

In other words, a species always breeds true; its members always generate organisms which can be classified as belonging to the *same* species, however much they vary among themselves as individuals within the group. Furthermore, the sub-groups—the races or varieties—of a species are able to breed with one another, but diverse species cannot interbreed. Organisms different in species either cannot mate productively at all, or if crossbred, like the horse and the ass, they produce a sterile hybrid like the mule.

In the hierarchy of classes, then, species would seem to be distinguished from all smaller groupings by their *stability* from generation to generation. If species are thus self-perpetuating, they in turn give stability to all the larger

groupings—the genera, phyla, families—which remain as fixed from generation to generation as the species which constitute them. Hence the question of origin applies peculiarly to species rather than to varieties or to genera.

On the supposition stated, no origin of species would seem to be possible except by a special act of creation. Either all the existing species of organisms have always existed from the beginning of life on earth; or, if in the course of ages new species have arisen, their appearance cannot be accounted for by natural generation. By the law of natural generation, offspring will always be of the same species as the parent organisms.

Spontaneous generation, of course, remains a possibility. A new species of organism might come to be without being generated by other living organisms. But apart from the question of fact (*i.e.*, whether spontaneous generation ever does occur), such origin of a form of life seems to lie outside the operation of natural causes and to imply the intervention of supernatural power.

The possibility of spontaneous generation was entertained in antiquity and the Middle Ages, and was even thought to be supported by observation, such as that of maggots emerging from putrefying matter. But modern science tends to affirm the biogenetic law that living organisms are generated only by living organisms. To Kant, the notion that "life could have sprung up from the nature of what is void of life," seems not only contrary to fact, but absurd or unreasonable. Yet, while affirming the principle that like produces like by insisting upon "the generation of something organic from something else that is also organic," Kant does not carry that principle to the point where it would make the generation of a *new* species impossible. "Within the class of organic beings," he writes, it is possible for one organism to generate another "differing specifically from it."

AGAINST THE BACKGROUND of these various suppositions, Darwin is moved to a new insight by the conjunction of certain types of fact: the results of breeding under domestication which exhibit the great range of variation within a species and the tendency of *inbred*

varieties to breed true; his own observations of the geographical distribution of species of flora and fauna, especially those separated from one another by impassable barriers; the facts of comparative anatomy and embryology which reveal affinities in organic structure and development between organisms distinct in species; and the geological record which indicates the great antiquity of life upon the earth, which gives evidence of the cataclysmic changes in the earth's surface (with consequences for the survival of life), and which above all contains the fossil remains of forms of life now extinct but not dissimilar from species alive in the present age.

Briefly stated, Darwin's insight is that new species arise when, among the varieties of an existing species, certain intermediate forms become extinct, and the other circumstances are such that the surviving varieties, now become more sharply separated from one another in type, are able to reproduce their kind, and, in the course of many generations of inbreeding, also tend to breed true. They thus perpetuate their type until each in turn ceases to be a species and becomes a genus when its own extreme varieties, separated by the extinction of intermediates, become new species, as they themselves did at an earlier stage of history. For the very same reason that Darwin says "a well-marked variety may be called an incipient species," a species may be called an incipient genus.

The point is misunderstood if it is supposed that when new species originate from old, both the new and the old continue to survive as species. On the contrary, when in the course of thousands of generations some of the varieties of a species achieve the status of species, the species from which they originated by variation ceases to be a species and becomes a genus.

"The only distinction between species and well-marked varieties," Darwin writes, "is that the latter are known, or believed, to be connected at the present day with intermediate gradations, whereas species were formerly thus connected . . . It is quite possible that forms now generally acknowledged to be merely varieties may hereafter be thought worthy of specific names; and in this case scientific and

common language will come into accordance. In short, we shall have to treat species in the same manner as those naturalists treat genera who admit that genera are merely artificial combinations made for convenience . . . Our classifications will come to be, as far as they can be so made, genealogies."

The *origin of species* thus seems to be identical with the *extinction of intermediate varieties*, combined with the survival of one or more of the extreme varieties. These seem to be simply two ways of looking at the same thing. Still another way of seeing the point may be achieved by supposing, contrary to fact, the survival of all the varieties ever produced through the breeding of organisms.

"If my theory be true," Darwin writes, "numberless intermediate varieties, linking closely together all the species of the same group, must assuredly have existed; but the very process of natural selection constantly tends, as has been so often remarked, to exterminate the parent-forms and the intermediate links." If one were to suppose the simultaneous co-existence of *all* intermediate varieties in the present day, the groups now called "species" would be continuously connected by slight differences among their members and would not, therefore, be divided into distinct species, as they now are because certain links are missing.

In the *Critique of Pure Reason*, Kant states the principle of continuity in the following manner. "This principle," he writes, "indicates that all differences of species limit each other, and do not admit of transition from one to another by a *saltus*, but only through smaller degrees of the difference between the one species and the other. In one word, there are no species or sub-species which . . . are the nearest possible to each other; intermediate species or sub-species being always possible, the difference of which from each of the former is always smaller than the difference existing between these." But, Kant adds, "it is plain that this continuity of forms is a mere idea, to which no adequate object can be discovered in experience," partly because "the species in nature are really divided . . . and if the gradual progression through their affinity were continuous, the intermediate members lying be-

tween two given species must be infinite in number, which is impossible."

The Russian geneticist, Theodore Dobzhansky, gives an interpretation of continuity in nature which differs from Kant's in that it follows and applies Darwin's conception of species and their origin. According to him, if we suppose the extreme case of all possible genetic variations being alive on earth together, the result would be not an infinite number of species, but no species and genera at all. The array of plants and animals would approach a perfectly continuous series in which there would only be individual differences. There would be no specific or generic groupings of the sort now made in our classification of the forms of life.

ON DARWIN'S conception of the origin of species its causes divide into two sets of factors: first, those which determine the extinction or survival of organisms and, with their survival, their opportunities for mating and reproduction; second, those which determine the transmission of characteristics from one generation to another and the variation of offspring from their ancestors and from each other. Without genetic variation there would be no range of differences within a group on which the factors of selection could operate. Without the inheritance of ancestral traits there would be no perpetuation of group characteristics in the organisms which manage to survive and reproduce.

For Darwin the operation of the first set of factors constitutes the process of natural selection. This may take place in many ways: through geological catastrophes which make certain areas of the earth's surface uninhabitable for all organisms, or for those types which cannot adapt themselves to the radically changed environment; through the competition among organisms for the limited food supply available in their habitat; through the struggle for existence in which organisms not only compete for food but also prey upon one another; through the sexual selection which operates within a group when some organisms are prevented by others from mating and reproducing; and through all the obstacles which isolate groups from interbreeding, in-

cluding geographical and physiological inaccessibility.

The struggle for existence is not only a struggle to survive, but also a struggle to reproduce. Natural selection operates with respect to reproduction as well as survival. Whether the survival is of the fittest alone, or whether the multiplication of inferior organisms also gives evolution another direction, has been disputed since Darwin's day; but according to his theory, "natural selection works solely by and for the good of each being; all corporeal and mental endowments will tend to progress toward perfection . . . Thus, from the war of nature, from famine and death . . . the production of the higher animals directly follows."

With respect to the factors of heredity and variation, tremendous advances since Darwin in the experimental science of genetics require revisions in this part of his theory of evolution. This is particularly true of the researches of Mendel, Bateson, and Morgan concerning the ways in which genetic factors operate. But on one major point in the theory of heredity Darwin holds a view which later investigations have tended to confirm. Antedating Weismann, he nevertheless opposes Lamarck's theory of the inheritance of acquired characteristics. As William James expresses it, where Lamarck supposes that environmental influences cause changes in the structure or functioning of the organism which then become hereditary, Darwin regards the environment merely as a selective agency, acting upon variations produced entirely by causes operating in the breeding process. James thinks "the evidence for Mr. Darwin's view . . . [was] . . . quite convincing," even before it received the support of Weismann's theory, according to which it is "*a priori* impossible that any peculiarity acquired during the lifetime by the parent should be transmitted to the germ."

The situation is not the same with regard to Darwin's views on the mechanism of heredity. Writing before Mendel's classic experiments in hybridization, Darwin seems to suppose a blending of hereditary factors; whereas, according to Mendel, inheritance is particulate. Distinct genetic factors combine to produce a certain somatic result without losing their

separate identities. They can therefore be reassorted and enter into new genetic combinations in the next generation. Most important of all, Darwin thinks that new forms of life arise gradually as the result of a continuous accumulation of slight and imperceptible variations. The opposite view is now taken. The discovery of abrupt mutations in a single generation discounts Darwin's maxim *natura non facit saltum*—"nature does nothing by jumps."

These advances in genetics since Darwin's day do not alter the main outlines of his theory. The mechanisms of heredity may be much more complicated than Darwin knew, and involve much of which he was ignorant, such as mutation-rates, or the various types, causes, and effects of hybridization. But that merely leads to a more elaborate or different explanation of genetic variation in offspring and the transmission of ancestral traits. No matter how these are explained, their occurrence is all that is needed to permit new species to originate through natural processes of heredity and selection. "If Darwin were alive today," Julian Huxley writes, "the title of his book would have to be not the 'origin' but the 'Origins of Species.' For perhaps the most salient single fact that has emerged from recent studies is that species may arise in a number of quite distinct ways."

THE READER MUST judge for himself to what extent Darwin's theory of evolution was anticipated by those who, like Augustine, affirm the appearance of new species of life on earth at various stages in its history, or even by a writer like Kant, who seems to possess the germ of its insight.

The critical test in every case is whether those who affirm the occurrence of *new* species by natural processes rather than by special creation, think of them as simply *added* to the organic forms already in existence without any change in the status as species of the pre-existing forms. Those who think in this way do not have Darwin's idea of the origin of species; for in conceiving an increase in the number of species as merely a matter of addition, they necessarily attribute stability to each species, new as well as old. By this test, not even Kant seems to be near the center of Darwin's hy-

pothesis of the origin of species by the extinction of intermediate varieties.

In comparing Darwin with certain of his predecessors, notably Aristotle and Aquinas, it seems necessary to apply another kind of test. Here the problem is not so much one of discovering affinities or disagreements, as one of determining whether they are talking about the same thing and therefore, when they appear to disagree, whether the issue between them is genuine. They do not seem to conceive a species in the same way. Certainly they use the word differently. This affects the way in which the whole problem of origins is understood. The controversies concerning the fixity or mutability of species, concerning evolution and creation, and concerning the origin of man involve genuine issues only if those who seem to disagree do not use the word "species" in widely different senses.

It is *possible* that certain forms of life do not originate by descent from a common ancestor and do not derive their status as quite distinct types from the mere absence of intermediate varieties—varieties which once must have existed but are now extinct. If such forms were to be called "species," the word would have a different meaning from the meaning it has when applied to types of pigeons, beetles, or rats.

The first of these two meanings may express the philosophical conception of a living species as a class of organisms having the same essential nature, according to which conception there never could have been intermediate varieties. The second meaning may be that of the scientific taxonomist in botany or zoology who constructs a system of classification, genealogical or otherwise. On this meaning, one million and a half would be a conservative estimate of the number of plant and animal types classified by the systematist as "species." In contrast, the number of species, in the philosophical sense of distinct essences, would be extremely small.

Darwin, for example, says, "I cannot doubt that the theory of descent with modification embraces all the members of the same great class or kingdom. I believe that animals are descended from at most only four or five progenitors, and plants from an equal or lesser

number. Analogy would lead me one step farther, namely, to the belief that all animals and plants are descended from some one prototype. But analogy may be a deceitful guide." It is immaterial to the theory of evolution, he adds, whether this inference, "chiefly grounded on analogy . . . be accepted."

The issue between Darwin and the theologians may or may not be genuine according to the interpretation of this passage, and according to the possibility of a double use of the word "species"—for both the small number of progenitors from which all the extant types of plants and animals have evolved, *and* for a very large number of those extant types. If the theologians use the word "species" in the first sense, and Darwin in the second, they need not be in disagreement. The "view of life" which Darwin attributes to certain eminent authorities, he himself does not flatly reject, namely, that life, "with its several powers [has] been originally breathed by the Creator into a few forms or into one."

Is there common ground here in the admitted possibility that life may have been originally created in a small number of distinct forms and that these are to be regarded as species in one conception, though not in another? If so, the affirmation of a certain fixity to species would apply only to a few primordial forms. Concerning forms which have appeared with the passage of time, two questions would have to be answered. First, are they species in the philosopher's sense of distinct and immutable essences, or species in the scheme of systematic biological classification? Second, is their first appearance at an historical moment due to a special act of creation, to spontaneous generation, or to evolution from already existing organic forms by "descent with modification"?

To join issue with Darwin, it would seem to be necessary for the person answering these questions to use the word "species" in the biologist's sense and at the same time to account for the historical origin of the new species by special creation or spontaneous generation. But in the tradition of the great books, theologians like Augustine and Aquinas do not attribute to God any special acts of creation after the original production of the world,

except to explain the origin of individual human souls.

"Nothing entirely new was afterwards made by God," Aquinas writes, "but all things subsequently made had in a sense been made before in the work of the six days . . . Some existed not only in matter, but also in their causes, as those individual creatures that are now generated existed in the first of their kind. Species also that are new, if any such appear, existed beforehand in various active powers; so that animals, and perhaps even new species of animals, are produced by putrefaction by the power which the stars and elements received at the beginning. Again, animals of new kinds arise occasionally from the connection of individuals belonging to different species, as the mule is the offspring of an ass and a mare, but even these existed previously in their causes, in the work of the six days."

WHETHER OR NOT the theologian's conception of an historical development of the forms of life conforms to the evolutionist's hypothesis, even though it does not offer the same type of explanation, is a matter which the reader of the texts must decide. But one issue, which still remains to be discussed, can leave little doubt of a basic controversy between Darwin and some of his predecessors, especially the theologians.

It concerns the origin and nature of man. It can be stated in terms of two views of human nature. One is that man is a species in the philosophical sense, essentially and abruptly distinct from brute animals; the other, that man is a species in the biologist's sense, and differs from other animals only by continuous variation.

On the first view, *either* man would have to be created, in body as well as soul; *or* if the human species has an origin which in part or whole involves the operation of natural causes, it must be conceived as *emerging* from a lower form of life. The rational soul, Aquinas maintains, "cannot come to be except by creation." But it is not only man's soul which, according to Aquinas, "cannot be produced save immediately by God." He also insists that "the first formation of the human body could not be by the instrumentality of any created power, but was im-

mediately from God." He does not reject the suggestion of Augustine that the human body may have preexisted in other creatures *as an effect preexists in its causes*. But he adds the qualification that it preexists in its causes only in the manner of a "passive potentiality," so that "it can be produced out of pre-existing matter only by God." A Christian theologian like Aquinas might entertain the hypothesis of emergent evolution as applied to the human organism, but only with the qualification that natural causes by themselves do not suffice for the production of man.

On the second view, which is Darwin's, man and the anthropoid apes have descended from a common ancestral form which is now extinct, as are also many of the intermediate varieties in the chain of development—unless, as it is sometimes thought, certain fossil remains supply some of the missing links. "The great break in the organic chain between man and his nearest allies, which cannot be bridged over by any extinct or living species, has often been advanced," Darwin admits, "as a grave objection to the belief that man is descended from some lower form; but this objection," he continues, "will not appear of much weight to those who, from general reasons, believe in the general principle of evolution. Breaks often occur in all parts of the series, some being wide, sharp and defined, others less so in various degrees, as between the orang and its nearest allies—between the *Tarsius* and the other *Lemuridae*—between the elephant, and in a more striking manner between the *Ornithorhynchus* or *Echidna*, and all other mammals." Furthermore, Darwin insists, no one who has read Lyell's *Antiquity of Man* "will lay much stress . . . on the absence of fossil remains"; for Lyell has shown "that in all the vertebrate classes the discovery of fossil remains has been a very slow and fortuitous process. Nor should it be forgotten that those regions which are the most likely to afford remains connecting man with some extinct ape-like creature, have not as yet been searched by geologists."

On either of these two conflicting views, the organic affinities between man and the most highly developed mammals would be equally intelligible, though they would be differently interpreted by Aquinas and Darwin. But ac-

cording to the doctrine of man's creation by God, or even on the hypothesis of emergent evolution, there need not be—strictly speaking, there *cannot* be—a missing link between ape and man, for the emergent species is a whole step upward in the scale of life. Man is thus not one of several organic types which have become species through the extinction of intermediate varieties, and hence he differs from other animals not in an accidental, but rather in an essential manner—that is, he differs in kind rather than degree.

This issue concerning human nature is discussed from other points of view in the chapters on ANIMAL and MAN. Here the issue, stated in terms of man's origin, seems to involve three possibilities: special creation, evolution by descent from a common ancestor, and emergent evolution. But these three possibilities apply not only to man, but to the origin of every species which did not exist at the first moment of life on earth.

The hypothesis of special creation does not seem to be held by the theologians, at least not in the tradition of the great books. The hypothesis of emergent evolution raises questions concerning the factors—natural or supernatural—which must be operative to cause the emergence of higher from lower forms of organic matter. Whether or not Aristotle and Aquinas can supply an answer to these questions in terms of their theory of matter's

potentiality for a variety of forms, Darwin's theory of descent with modification seems to be definitely opposed to the hypothesis of emergent evolution. Speaking as a Darwinian, James says that "the point which as evolutionists we are bound to hold fast to is that all the new forms of being that make their appearance are really nothing more than results of the redistribution of the original and unchanging materials . . . No new *natures*, no factors not present at the beginning, are introduced at any later stage."

In this dispute between two theories of evolution, does not the solution depend in every case upon a prior question concerning the relation of the species under consideration—whether or not it is possible for them to be or to have been developmentally connected by intermediate varieties? If, for example, the evidence were to prove that man and ape, as they now exist in the world, are essentially distinct—different in kind—then no intermediate varieties could ever have existed to account for their descent from a common ancestor. If, on the other hand, the evidence were to prove that they differ only in degree, then no difficulty stands in the way of the Darwinian hypothesis. The ultimate issue concerning the origin of species would thus seem to reduce to the problem of which meaning of "species" applies to the organic types in question.

OUTLINE OF TOPICS

	PAGE
1. The classification of animals	461
1a. Comparison of genealogical classification with other types of taxonomy: the phylogenetic series	
1b. The criteria for distinguishing races or varieties, species, genera, and all higher taxonomic groupings	
2. Genetic variation in the course of generations	
2a. Comparison of variation under conditions of natural and artificial breeding	462
2b. Characteristics which are more and less variable genetically: their bearing on the distinction of races, species, and genera	
3. The process of heredity	
3a. The inheritance of acquired characteristics: the use and disuse of parts

- 3c. Interbreeding and crossbreeding: hybridism and sterility
- 3d. Atavisms and reversions to ancestral type 463
- 3e. Marked and abrupt mutations in a single generation as opposed to the continuous accumulation of slight and imperceptible variations
- 4. The problem of evolution: the origin of plant and animal species
 - 4a. The question of ultimate origins: the creation of primordial life in one or many forms; the original generation of life from inorganic matter
 - 4b. The fixity or the mutability of species
 - 4c. The origin of new forms of life: special creation, spontaneous generation, or descent with modification from older forms
 - 4d. The direction of evolution: progress and recession 464
- 5. The theory of evolution: the origin of new species from a common ancestry
 - 5a. The struggle for existence: its causes and consequences
 - (1) Natural selection: the survival of the fittest
 - (2) The extinction of intermediate varieties
 - (3) Difficulties with the theory of natural selection: its limitations
 - 5b. Competition in mating: sexual selection
 - 5c. The geographical and physiological factors in breeding: accessibility, fertility, and sterility
- 6. The facts of evolution: evidences bearing on the history of life on earth
 - 6a. The geological record: the significance of fossil remains
 - 6b. The geographical distribution of the forms of life in relation to the genealogy of existing species
 - 6c. Comparative anatomy and embryology: the meaning of rudimentary or vestigial organs and functions
- 7. The origin and development of man 465
 - 7a. The doctrine of man's special creation: in body, in soul
 - 7b. The theory of the evolutionary origin of man from lower forms of animal life: descent from an ancestor common to man and the anthropoids
 - (1) Anatomical, physiological, and embryological evidences of an organic affinity between man and other mammalian forms of life
 - (2) Paleontological evidences: the missing link in man's ancestry
 - (3) Psychological evidences: the human mind in relation to animal intelligence
 - 7c. Biological evolution in the course of human generation: from prehistoric to historic man

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 25: EXPERIENCE

INTRODUCTION

EXPERIENCE is regarded as a source of knowledge. It is also spoken of as containing what is known.

Sometimes it is identified with sense-perception; sometimes it involves more—memory and the activity of the imagination. Sometimes it includes thoughts, feelings, and desires as well, all the contents of consciousness, every phase of mental or psychic life. The temporal flow of experience is then identified with the stream of consciousness.

Experience may connote something which is private or public, subjective or objective—something which no man can share with another or something which is common to all men who live in the same world and who are acquainted with the same objects.

There are still other divisions of experience: intuitive or aesthetic experience, religious experience, and mystical experience.

Experience is said to be that which makes a man expert in an art or in a sphere of practical activity. A man is better able to do or make that which he has much experience in doing or making. He is also better able to judge what should be undertaken or what has been accomplished by others as well as by himself. In this connection experience is called practical, both because it is the result of practice and because it is a means to be used in directing action. But it is also praised for the opposite reason—as something to be enjoyed for its own sake, serving no end beyond itself unless it be the enrichment of life by the widest variety of experiences.

THESE ARE SOME of the myriad meanings of "experience"—not all, but those which occur with major emphasis in the tradition of the great books. No author uses the word in all these senses. Some of these senses are contra-

dictory. According to the context of the discussion or the subject matter under consideration, the same author will shift from one meaning to another.

For example, in his account of the origin of science, Aristotle says that "out of sense-perception comes to be what we call memory, and out of frequently repeated memories of the same thing develops experience; for a number of memories constitute a single experience." The further product of experience—"the universal stabilized in its entirety within the soul"—is obtained by abstraction and the related act of induction or generalization. Art or science arises, Aristotle writes, "when from many notions gained by experience, one universal judgment about a class of objects is produced." Hence it can be said, he thinks, that from experience "originate the skill of the craftsman, the knowledge of the man of science, skill in the sphere of coming to be and science in the sphere of being."

In the study of nature, experience, according to Aristotle, is essential for "taking a comprehensive view of the admitted facts" which can come only from dwelling "in intimate association with nature and its phenomena." In the context of ethical or political problems, he treats experience as the basis for a prudent judgment, which is not "concerned with universals only," but "must also recognize the particulars." This fact, Aristotle writes, explains "why some who do not know," but who "have experience, are more practical than others who know." In the field of poetry, as in moral matters, it is the man of experience, according to Aristotle, who can best judge what is good or bad; he can "judge rightly the works produced . . . and understand by what means or how they are achieved, and what harmonizes with what," whereas "the inexperienced must

be content if they do not fail to see whether the work has been well or ill made."

Hobbes and William James also use the word for the possession of expertness or sound judgment in practical affairs, as well as in connection with the origin or nature of knowledge. Hobbes, like Aristotle, says that "much memory, or memory of many things, is called *Experience*." He connects it with prudence. It is that knowledge, he writes, which "is not attained by reasoning, but found as well in brute beasts as in man; and is but a memory of successions of events in times past, wherein the omission of every little circumstance altering the effect, frustrates the expectation of the most prudent."

For James, however, experience is usually identified with the stream of consciousness. "Experience moulds us every hour," he writes, "and makes of our minds a mirror of the time-and-space-connections between the things in the world." He distinguishes it from conception, reasoning, or thought, and associates it with sensation and feeling. "The way of 'experience' proper is the front door," he writes, "the door of the five senses."

For the most part, experience is a term in psychological analysis, with implications for the development of theoretic knowledge or practical wisdom. That is the way it is chiefly used by Aquinas, Bacon, Descartes, Spinoza, Locke, and Hume, as well as the authors already mentioned. It is still a term in the dimension of psychology when it is used by Plotinus and by the theologians to discuss the mystical union of the soul with God.

But with Hume experience also is reality or, in his phrase, the realm of "matters of fact and existence," as opposed to "relations of ideas." He tends to identify the order of nature with the succession of events in experience, though he also seems to conceive a "pre-established harmony between the course of nature and the succession of our ideas." Nature, he goes on to say, "has implanted in us an instinct, which carries forward the thought in a correspondent course to that which she has established among external objects."

Hume's difficulty or indecision with regard to the objectivity of experience does not appear in Kant, for whom experience ceases to be psychological in any subjective sense of that word.

The order of nature—the object of the theoretic sciences—is the order of experience. In Kant's technical sense of *mögliche erfahrung*, nature is the realm of all possible experience. His distinction between judgments of perception and judgments of experience differentiates what for other writers is subjective sense-experience, from knowledge of reality or of objects shared by many minds.

Experience is the domain of such public objects precisely because its sense-materials are formed and ordered by the structure of the mind itself—by the forms of intuition and the categories of the understanding in a synthesis which Kant calls the "transcendental unity of apperception." Without this synthesis, experience "would be merely a rhapsody of perceptions, never fitting together into any connected text, according to rules of a thoroughly united (possible) consciousness, and therefore never subjected to the transcendental and necessary unity of apperception."

Though it may not seem possible, William James goes further than Kant in the conception of experience as a realm of being. Kant does not think that *all possible experience* circumscribes reality. "That which is not phenomenon," he writes, "cannot be an object of experience; it can never overstep the limits of sensibility, within which alone objects are presented to us." In contrast to this phenomenal reality with which he identifies experience, Kant posits a noumenal world—a world of intelligible or supra-sensible beings. To this realm, Kant writes, belong those "possible things which are not objects of our senses, but are cogitated by the understanding alone." Since the things Kant calls *ding-an-sich* are unconditioned, that is, not subject as they are in themselves to the forms of intuition or the categories of the understanding, they cannot have an empirical or sensible reality, but only an intelligible existence.

William James goes further in his *Essays in Radical Empiricism*, when he takes experience as equivalent to the whole of reality, including the actual and the possible or imaginary, the concrete and the abstract, the objective and the subjective. All differentiations must be made within experience, and experience itself is neutral with respect to all distinctions—re-

ceptive of all. There can be no meaningful distinction between experience and some other realm of existence. It is in this all-inclusive sense that experience is said to be the central term in the philosophy of John Dewey when it functions as *mind* does for Hegel, *substance* for Spinoza, or *being* for Aquinas and Aristotle.

WE HAVE GONE from one extreme to another in passing from a purely psychological to something like a metaphysical conception of experience. These are opposite in a way which suggests the contrast between the practical and the aesthetic values of experience—the actively useful and the intrinsically enjoyable. At least the metaphysical identification of experience with all existence seems analogous to the aesthetic ideal of a life which embraces every variety of experience.

There is some intimation of this ideal in the lust for adventure which motivates Odysseus and his men. Dante, in fact, finds the secret of his character in the ardor of Odysseus "to become experienced of the world, and of the vices of men, and of their virtue," which leads him "to pursue virtue and knowledge," even to the point of his "mad flight."

There is some suggestion of this ideal of experience in the unbounded vitality of Gargantua and Pantagruel, and in the enterprise of the Wife of Bath, in Chaucer's tale. But the great poetic expression of this ideal is written in *Faust*—in the worlds of experience Mephistopheles opens to the man who has wagered his soul for one ultimately satisfying moment.

Whatever to all mankind is assured,
I, in my inmost being, will enjoy and know,
Seize with my soul the highest and most deep;
Men's weal and woe upon my bosom heap;
And thus this self of mine to all their selves
expanded,
Like them I too at last be stranded.

THE BASIC ISSUE concerning the role of experience in the origin of knowledge, especially the organized knowledge of the arts and sciences, turns on whether it is *the* source or only *a* source. It is rarely if ever supposed that nothing can be learned from experience, or that everything worth learning can come to be known entirely apart from experience. During the early centuries of Christianity, devoutly religious men

preached that God has revealed to man all he needs to know in order to live well and be saved. But this extreme position rejects the constructions of reason as well as the materials of experience.

Among philosophers and scientists, concerned with what man can learn by the exercise of his own powers, the controversy over experience usually involves a distinction between the senses and the reason or intellect. As indicated in the chapters on IDEA, MIND, and SENSE, whether this distinction can be validly made is itself a major issue in the tradition of the great books. Those who make it, however, tend to regard experience as something which results from the activity of the senses. For them the problem is whether our ideas—the general notions or concepts that enter into our scientific judgments and reasoning—come from sense-experience, which either is or originates from the perception of particulars. The contrast between the particular and the universal, between percept, sense-impression, or concrete image on the one hand, and concept or abstract idea, on the other, lies at the heart of the problem.

One possibility is that the mind, by processes of abstraction or induction, somehow draws all its concepts and generalizations from experience. Aquinas is representative of this view. He adopts Aristotle's notion that the intellect is "like a tablet on which nothing is written." This *tabula rasa* depends upon the senses and the imagination for the materials out of which concepts are formed. "For the intellect to understand actually," Aquinas writes, "not only when it acquires new knowledge, but also when it uses knowledge already acquired, there is need for the act of the imagination and of the other powers."

Without experience the mind would remain empty, but experience itself does not fill the intellect with ideas. The activity of the sensitive faculty is not by itself the cause of knowledge. The perceptions and images furnished by sense-experience, Aquinas writes, "need to be made actually intelligible," and this requires the activity of the intellect, not merely its passivity in receiving impressions from experience. For this reason, he concludes, "it cannot be said that sensitive knowledge is the total and perfect cause of intellectual knowledge, but

rather that it is in a way the material cause." Although experience is the indispensable source of the materials on which the intellect actively works, knowledge worthy of the name of science or of art does not come from experience alone.

Thus we see that those who, like Aquinas, affirm that there is nothing in the intellect which was not previously in the senses do not mean to imply that the materials of sense-experience reach the intellect untransformed. On the contrary, the primary contribution of the intellect is the translation of experienced particulars into universal notions. Nor do those who, like Bacon, affirm that the principles of knowledge are obtained by induction from experience necessarily imply that all knowledge is *directly* drawn from experience. To the extent that deductive reasoning is a way of learning new truths, the truths thus learned derive from experience only indirectly. Their direct source is truths already known, which must in turn have come from experience by induction.

Harvey criticizes those who misconceive the part which reason should play in relation to the senses. In the field of his own inquiries, "some weak and inexperienced persons," he writes, "vainly seek by dialectics and far-fetched arguments, either to upset or establish things that are only to be founded on anatomical demonstration, and believed on the evidence of the senses. . . . How difficult it is," he continues, "to teach those who have no experience, the things of which they have not any knowledge by their senses!"

As in geometry, so in all the sciences, according to Harvey, it is the business of reason "from things sensible to make rational demonstration of the things that are not sensible; to render credible or certain things abstruse and beyond sense from things more manifest and better known." Science depends upon both reason and sense; but sense, not reason, is the ultimate arbiter of what can be accepted as true. "To test whether anything has been well or ill advanced, to ascertain whether some falsehood does not lurk under a proposition, it is imperative on us," Harvey declares, "to bring it to the proof of sense, and to admit or reject it on the decision of sense."

THE FOREGOING views are not a necessary consequence of the distinction between the faculties of sense and reason. The theory of innate ideas presents another possibility. As expressed by Descartes, for example, this theory holds that there are "purely intellectual [ideas] which our understanding apprehends by means of a certain inborn light." Hence it would seem that experience can be dispensed with, except for its value in dealing with particulars. But for most of the writers who take this view, experience, in addition to providing acquaintance with particulars, acts as the stimulus or the occasion for the development of the seeds of knowledge implanted in the mind at birth. Although he rests his metaphysics on the innate ideas of self and God, Descartes also appeals to experimental knowledge in the sphere of natural science. To answer such a question as, "what is the nature of the magnet?" the inquirer must "first collect all the observations with which experience can supply him about this stone, and from these he will next try to deduce its character."

The extreme position which denies any role to experience can be taken only by those who think that the growth of actual knowledge from innate ideas requires no outside impetus; and perhaps also by those who make ideas the objects of the mind's intuitive apprehension. It is questionable whether anyone goes to this extreme without the qualification that, for particulars at least, sense-experience is knowledge.

The other extreme—that experience is the *only* source of knowledge—is approached by those who deny the distinction in faculties, and substitute for the duality of sense and reason, each with its characteristic contribution to human knowledge, a distinction between the function of perceiving and that of reworking the received materials. Though in different ways. Hobbes, Locke, Berkeley, and Hume all appear to take this position.

They represent, according to James, "the empirical school in psychology." He tries to summarize their view by saying that "if *all* the connections among ideas in the mind could be interpreted as so many combinations of sense-data wrought into fixity . . . then experience in the common and legitimate sense of the word would be the sole fashioner of the mind." If,

in other words, all that is done with the sensations, impressions, or ideas—whatever term is used for the original data of experience—consists in their reproduction by memory and imagination, and their comparison, combination, and connection in various ways to produce complex ideas, judgments, and trains of reasoning, then the entire content of human knowledge can be reduced to elements derived exclusively from experience.

Whether this position is taken *with* or *without* qualification depends on the disposition that is made of the problem of universals or abstractions, which is more fully discussed in the chapters on *IDEA*, *SENSE*, and *UNIVERSAL*. Locke's treatment of abstract ideas and the special consideration given by Hume to the concepts of mathematics suggest that there are kinds or aspects of knowledge which cannot be accounted for by reduction to experience. Both men introduce a certain qualification upon their empiricism. However slight that may be, it does not appear in Hobbes and Berkeley, for they completely deny the existence of abstract or universal notions in the mind. If "abstract," "universal," or "general" applies to names alone, then the mind or understanding adds nothing to, and does not radically transform, the materials of experience.

THE CONTROVERSY concerning experience and knowledge can also be stated in terms of the opposition between the *a priori* and the *a posteriori*. These terms are sometimes used to signify what is possessed before and what comes after or from experience, and sometimes they are used to indicate, without reference to the time order, what is independent of and what is dependent upon experience.

The distinction between the *a priori* and the *a posteriori* is not made in the same way with respect to propositions or judgments and with respect to reasoning or inference. The distinction and its significance for science and philosophy are discussed in the chapters on *JUDGMENT* and *REASONING*. It is sufficient here to point out that an *a priori* judgment is not determined by experience nor does it need empirical verification.

It might at first be supposed that those who agree in thinking that experience is just one—

not the only—source of knowledge would also agree that some judgments, especially the basic propositions of science, are *a priori*. But this does not appear to be the case. Bacon, for example, like Aristotle, holds that the principles of the various sciences are derived by induction from experience. "There are and can exist," he writes, "but two ways of investigating and discovering truth. The one hurries on rapidly from the senses and particulars to the most general axioms, and from them, as principles and their supposed indisputable truth, derives and discovers the intermediate axioms. . . . The other constructs its axioms from the senses and particulars, by ascending continually and gradually, till it finally arrives at the most general axioms." All axioms, on this view, are *a posteriori* propositions.

Descartes and Kant, while differing in the terms of their analysis, think, as we have seen, that the mind itself provides the ground for certain judgments which are therefore *a priori*. It does not even seem to be the case that those who make experience the only source of knowledge regard all propositions as *a posteriori*. Hume's treatment of mathematical propositions and James' treatment of axioms or necessary truths seem to be the exceptions here.

There is still another way in which the issue can be stated. The question is whether human knowledge extends to objects beyond experience, to things or beings which are not sensible and which transcend all possible experience.

Again it might be supposed that those who take an *a posteriori* view of the origin of knowledge would also limit apprehension to things experienceable. But Aristotle and Aquinas seem to say that the origin of knowledge from experience does not restrict the knowable to things capable of being experienced. Aquinas cites Aristotle's work on the heavens to show that "we may have a scientific knowledge" of things we cannot experience, "by way of negation and by their relation to material things." He would hold what is true of astronomy to be even more the case in metaphysics and theology. Even though all our concepts are abstracted from experience, we can by means of them reach beyond the sensible world to purely intelligible realities—to immaterial and non-sensible beings or aspects of being. Locke, who may be thought

even more emphatic than Aristotle or Aquinas in his insistence on the empirical origin of knowledge, goes as far as they do in affirming man's knowledge of God and the soul.

Hume, in contrast, holds that knowledge may go beyond experience only if it is knowledge of the relation of our ideas, as exemplified in the science of mathematics. Precisely because mathematics is not knowledge of matters of fact or real existence, its propositions are, according to Hume, "discoverable by the mere operation of thought, without dependence on what is anywhere existent in the universe." But with regard to "matters of fact," Hume thinks that "experience is our only guide."

Any science which claims to be knowledge of reality or existence rather than of the relations between ideas, is thus limited to the realm of experienceable objects. According as the objects of a science fall within experience, so also must its conclusions be verified by reference to experience. Experience is the ultimate test of what truth there is in the propositions of natural science. Only the propositions of mathematics can have a validity which does not require empirical verification.

By these criteria Hume challenges the validity of metaphysics or natural theology. Such disciplines claim to be knowledge of real existences, but their objects are not experienceable and their conclusions cannot be empirically verified. The existence of God, and the immortality of the soul may be objects of faith, but they are not verifiable conclusions of science; nor for that matter can metaphysics give us scientific knowledge of the ultimate constitution of the physical world if that involves knowledge of substances and causes which lie behind the phenomena and outside of experience. "All the philosophy in the world," Hume writes, "and all the religion . . . will never be able to carry us beyond the usual course of experience."

Kant, like Hume, limits theoretic knowledge to mathematics and the study of nature. A metaphysics which pretends to know objects outside the phenomenal order cannot be defended. "The understanding has no power to decide," he writes, "whether other perceptions besides those which belong to the total of our possible experience [exist], and consequently

whether some other sphere of matter exists." What transcends all possible experience, in other words, cannot be known, at least not in the manner of the speculative sciences; only the moral sciences, proceeding in a different fashion, have access to the realm of the supra-sensible.

Kant's position seems to resemble Hume's. But it involves a quite different conception of mathematics and natural science, especially the latter, which Kant divides into pure and empirical physics. Kant identifies "pure physic" with the "metaphysic of nature" in distinction from the "metaphysic of morals," the one a theoretic, the other a practical science. For Kant the principles of both mathematics and pure physics are *a priori* rather than *a posteriori*; the objects of both are objects of actual or possible experience.

IN THE CLASSIFICATION of sciences, the natural sciences are usually set apart from mathematics, as well as from metaphysics, by being called "empirical" or "experimental." These names signify not merely the inductive method by which the knowledge is obtained from experience; they also imply that hypotheses, however formulated, and conclusions, however reached, must be verified by the facts of experience. Newton states it as a rule of reasoning "in experimental philosophy [that] we are to look upon propositions inferred by general induction from phenomena as accurately or very nearly true, notwithstanding any contrary hypotheses that may be imagined, till such time as other phenomena occur, by which they may either be made more accurate, or liable to exceptions." In similar tenor, Lavoisier says that "we ought, in every instance, to submit our reasoning to the test of experiment, and never to search for truth but by the natural road of experiment and observation."

The two words "empirical" and "experimental" should not, however, be used interchangeably. No science can be experimental without being empirical, but, as the chapter on ASTRONOMY indicates, the converse does not appear to be true.

There seem to be three different types of experience from which knowledge can be derived: (1) the ordinary everyday experiences which men accumulate without making any

special effort to investigate, explore, or test; (2) the special data of experience which men collect by undertaking methodical research and making systematic observations, with or without apparatus; and (3) experiences artificially produced by men who exercise control over the phenomena and with respect to which the observer himself determines the conditions of his experience. "Those experiences which are used to prove a scientific truth," James writes, "are for the most part artificial experiences of the laboratory, gained after the truth itself has been conjectured."

Of these three only the last is an experimental experience. The first type of experience may be employed by the scientist, but it is seldom sufficient or reliable enough for his purposes. The distinction between the empirical sciences which are and those which are not experimental turns on the difference between the second and third types.

It is not always possible for the scientist to perform experiments, as, for example, in astronomy, where the phenomena can be methodically observed and exactly recorded, but cannot be manipulated or controlled. Among the great books of natural science, the biological writings of Hippocrates, Aristotle, Galen, and Darwin, the astronomical works of Ptolemy, Copernicus, Kepler, and Newton, and the clinical studies of Freud are examples of scientific works which are more or less empirical, but not experimental. In contrast, Galileo's *Two New Sciences*, Newton's *Optics*, Harvey's *Motion of the Heart and Blood*, Lavoisier's *Elements of Chemistry*, and Faraday's *Experimental Researches in Electricity* represent empirical science which has recourse to experimentation at crucial points.

ON THE SIDE of their production, experiments are like inventions. They do not happen by chance or without the intervention of art. They are usually performed under carefully controlled conditions and by means of apparatus artfully contrived. This explains the interplay between technology and experimental science. Progress in each occasions progress in the other.

On the side of their utility, experiments seem to serve three different though related purposes in scientific work. In those branches of physics

which are both mathematical and experimental, the experiment enables the scientist to make exact measurements of the phenomena and so to determine whether one or another mathematical formulation fits the observable facts of nature. Investigating accelerated motion, Galileo seeks not only to demonstrate its definition and its properties, but also to show that "experimental results . . . agree with and exactly correspond with those properties which have been, one after another, demonstrated by us."

The experiment of the inclined plane yields measurements which exemplify those ratios between space and time that are determined by one rather than by another mathematical definition of the acceleration of a freely falling body. The experiment is thus used to decide between two competing mathematical theories, choosing that one "best fitting natural phenomena." In those sciences, Galileo writes, "in which mathematical demonstrations are applied to natural phenomena . . . the principles, once established by well-chosen experiments, become the foundation of the entire super-structure."

Concerned with the phenomena of heat, Fourier makes the same point concerning the relation of mathematics and experiments. "Mathematical analysis," he says, "can deduce from general and simple phenomena the expression of the laws of nature; but the special application of these laws to very complex effects demands a long series of exact observations" for which experiments are needed.

In addition to testing hypotheses and providing measurements whereby mathematical formulations can be applied to nature, experiments function as the source of inductions. A crucial experiment constitutes a single clear case from which a generalization can be drawn that is applicable to all cases. Newton's optical experiments are of this sort. He calls this use of experiments "the method of analysis." It consists in "making experiments and observations, and in drawing general conclusions from them by induction. . . . And although the arguing from experiments and observations by induction be no demonstration of general conclusions, yet it is the best way of arguing which the nature of things admits of."

A third use for experiments is in the exploration of new fields of phenomena, for purposes

of discovery rather than of induction or verification. Hypotheses may result from such explorations, but in the first instance, the experimentation may be undertaken without the guidance of hypotheses. This employment of experimental technique is illustrated by Faraday's remark that "the science of electricity is in that state in which every part of it requires experimental investigation, not merely for the discovery of new effects, but what is just now of far more importance, the development of the means by which the old effects are produced."

Experimental exploration, apart from the direction of hypotheses, seems to be a procedure of trial and error. Experimentation in this sense reflects what Hippocrates had in mind when he spoke of "the experiment perilous." In the work of Hippocrates at the very beginning of empirical science, recourse to experiment, far from being the most prized technique, signified a lack of scientific knowledge. Only the physician who could not cure the patient by art based on science took the risk of experimenting —of proceeding by trial and error.

OUTLINE OF TOPICS

	PAGE
1. Various conceptions of experience	476
2. Experience in relation to the acts of the mind	
2a. Memory and imagination as factors in or products of experience	477
2b. The empirical sources of induction, abstraction, generalization	
2c. The transcendental or innate structure of the mind as a condition of experience	
2d. The <i>a priori</i> and <i>a posteriori</i> in judgment and reasoning	478
3. Experience in relation to organized knowledge: art and science	
3a. Particular experiences and general rules as conditions of expertness or skill: the contrast between the empiric and the artist	
3b. The issue concerning the role of experience in science	479
4. Experience as measuring the scope of human knowledge	
4a. The knowability of that which is outside experience: the supra-sensible, the noumenal or transcendent	
4b. Verification by experience: experience as the ultimate test of truth	480
5. The theory of experimentation in scientific method	
5a. Experimental exploration and discovery: the formulation of hypotheses	481
5b. Experimental verification: the testing of hypotheses	
5c. Experimental measurement: the application of mathematics	
6. The man of experience in practical affairs	482
6a. Experience as indispensable to sound judgment and prudence	
6b. The role of experience in politics: the lessons of history	
7. Mystical or religious experience: experience of the supernatural	
8. Variety of experience as an ideal of human life	483

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Various conceptions of experience

- 8 ARISTOTLE: *Interpretation*, CH I [16^a3-8] 25a / *Posterior Analytics*, BK II, CH I9 [99^b34-100^a9] 136b-c / *Metaphysics*, BK I, CH I [980^b25-981^b9] 499b-d
- 19 AQUINAS: *Summa Theologica*, PART I, Q 54, A 5 288a-d; Q 58, A 3, REP 3 301d-302d; Q 64, A 1, REP 5 334a-335c
- 20 AQUINAS: *Summa Theologica*, PART I-II, Q 112, A 5, ANS and REP I, 5 359c-360c
- 23 HOBBS: *Leviathan*, PART I, 50d; PART II, 128c; PART IV, 267b
- 25 MONTAIGNE: *Essays*, 516b-524a
- 28 HARVEY: *On Animal Generation*, 334a-335a

Chapter 26: FAMILY

INTRODUCTION

THE human family, according to Rousseau, is "the most ancient of all societies and the only one that is natural." On the naturalness of the family there seems to be general agreement in the great books, although not all would claim, like Rousseau, that it is the *only* natural society. The state is sometimes also regarded as a natural community, but its naturalness is not as obvious and has often been disputed.

The word "natural" applied to a community or association of men can mean either that men *instinctively* associate with one another as do bees and buffaloes; or that the association in question, while voluntary and to that extent conventional, is also *necessary* for human welfare. It is in this sense of necessity or need that Rousseau speaks of family ties as natural. "The children remain attached to the father only so long as they need him for their preservation," he writes. "As soon as this need ceases, the natural bond is dissolved." If after that "they remain united, they continue so no longer naturally, but voluntarily; and the family itself is then maintained only by convention."

Locke appears to attribute the existence of the human family to the same sort of instinctive determination which establishes familial ties among other animals, though he recognizes that the protracted infancy of human offspring make "the conjugal bonds . . . more firm and lasting in man than the other species of animals." Since with other animals as well as in the human species, "the end of conjunction between male and female [is] not barely procreation, but the continuation of the species," it ought to last, in Locke's opinion, "even after procreation, so long as is necessary to the nourishment and support of the young ones, who are to be sustained by those who got them till they are able to shift and support for themselves. This rule," he adds, "which the infinite

wise Maker hath set to the works of His hands, we find the inferior creatures steadily obey."

Yet Locke does not reduce the association of father, mother, and children entirely to a divinely implanted instinct for the perpetuation of the species. "Conjugal society," he writes, "is made by a voluntary compact between man and woman, and though it consists chiefly in such a communion and right in one another's bodies as is necessary to its chief end, procreation, yet it draws with it mutual support and assistance, and a communion of interests, too."

If the human family were *entirely* an instinctively formed society, we should expect to find the pattern or structure of the domestic community the same at all times and everywhere. But since the time of Herodotus, historians and, later, anthropologists have observed the great diversity in the institutions of the family in different tribes or cultures, or even at different times in the same culture. From his own travels among different peoples, Herodotus reports a wide variety of customs with respect to marriage and the family. From the travels of other men, Montaigne culls a similar collection of stories about the diversity of the mores with respect to sex, especially in relation to the rules or customs which hedge the community of man and wife.

Such facts raise the question whether the pattern of monogamy pictured by Locke represents anything more than one type of human family—the type which predominates in western civilization or, even more narrowly, in Christendom. Marx, for instance, holds that the structure of the family depends on the character of its "economical foundation," and insists that "it is of course just as absurd to hold the Teutonic-Christian form of the family to be absolute and final as it would be to apply that character to the ancient Roman, the ancient

Greek, or the Eastern forms which, moreover, taken together form a series in historic development."

Though the observation of the various forms which the human family takes has led some writers to deny the naturalness of the family—at least so far as its "naturalness" would mean a purely instinctive formation—it has seldom been disputed that the family fulfills a natural human need. Conventional in structure, the family remains natural as a means indispensable to an end which all men *naturally* desire. "There must be a union of those who cannot exist without each other," Aristotle writes, "namely, of male and female, that the race may continue"; and he goes on to say that this union is formed "not of deliberate purpose, but because, in common with other animals and with plants, mankind have a natural desire to leave behind them an image of themselves."

The human infant, as Locke observes, requires years of care in order to survive. If the family did not exist as a relatively stable organization to serve this purpose, some other social agency would have to provide sustained care for children. But wherever we find any other social units, such as tribes or cities, there we also find some form of the family in existence, not only performing the function of rearing children, but also being the primitive social group out of which all larger groupings seem to grow or to be formed. Aristotle, for example, describes the village or tribe as growing out of an association of families, just as later the city or state comes from a union of villages.

We have seen that the naturalness of the family—as answering a natural need—is not incompatible with its also being a product of custom or convention. The facts reported by Herodotus, Montaigne, and Darwin, which show the variability of families in size and membership, in form and government, do not exclude, but on the contrary emphasize, the further fact that wherever men live together at all, they also live in families.

Whether or not the political community is also a natural society, and if so, whether it is natural in the same way as the family, are questions reserved for the chapter on STATE. But it should be noted here that for some writers, for Aristotle particularly and to a lesser extent

for Locke, the naturalness of the family not only points to a natural development of the state, but also helps to explain how, in the transition from the family to the state, paternal government gives rise to royal rule or absolute monarchy. Even Rousseau, who thinks that the family is the *only* natural society, finds, in the correspondence between a political ruler and a father, reason for saying that "the family . . . may be called the first model of political societies."

IN WESTERN CIVILIZATION, a family normally consists of a husband and wife and their offspring. If the procreation and rearing of offspring is *the* function, or even *a* function, which the family naturally exists to perform, then a childless family cannot be considered normal. Hegel suggests another reason for offspring. He sees in children the bond of union which makes the family a community.

"The relation of love between husband and wife," he writes, "is in itself not objective, because even if their feeling is their substantial unity, still this unity has no objectivity. Such an objectivity parents first acquire in their children, in whom they can see objectified the entirety of their union. In the child, a mother loves its father and he its mother. Both have their love objectified for them in the child. While in their goods their unity is embodied only in an external thing, in their children it is embodied in a spiritual one in which the parents are loved and which they love."

Until recent times when it has been affected by urban, industrial conditions, the family tended to be a much larger unit, not only with regard to the number of children, but also with respect to other members and relationships. The household included servants, if not slaves; it included blood-relatives in various degrees of consanguinity; its range extended over three or even four generations. Sancho Panza's wife, for instance, pictures the ideal marriage for her daughter as one in which "we shall have her always under our eyes, and be all one family, parents and children, grandchildren and sons-in-law, and the peace and blessing of God will dwell among us." Even though they belong to the nineteenth century, the families in *War and Peace* indicate how different is the domestic

establishment under agrarian and semi-feudal conditions.

But even when it comprised a larger and more varied membership, the family differed from other social units, such as tribe or state, in both size and function. Its membership, determined by consanguinity, was usually more restricted than that of other groups, although blood-relationships, often more remote, may also operate to limit the membership of the tribe or the state. Its function, according to Aristotle, at least in origin, was to "supply men's everyday wants," whereas the state went beyond this in aiming at other conditions "of a good life."

In an agricultural society of the sort we find among the ancients, the household rather than the city is occupied with the problems of wealth. In addition to the breeding and rearing of children, and probably because of this in part, the family as a unit seems to have been concerned with the means of subsistence, on the side of both production and consumption. Its members shared in a division of labor and in a division of the fruits thereof.

Apart from those industries manned solely by slave labor in the service of the state, the production of goods largely depended on the industry of the family. In modern times this system of production came to be called the "domestic" as opposed to the "factory" system. It seems to persist even after the industrial revolution. But, according to Marx, "this modern so-called domestic industry has nothing, except the name, in common with the old-fashioned domestic industry, the existence of which presupposes independent urban handicrafts, independent peasant farming, and above all, a dwelling house for the laborer and his family."

In effect, the industrial revolution produced an economy in which not only agriculture but the family ceased to be central. The problem shifts from the wealth of families to the wealth of nations, even as production shifts from the family to the factory. "Modern industry," according to Marx, "by assigning an important part in the process of production, outside the domestic sphere, to women, to young persons, and to children of both sexes, creates a new economical foundation."

The family was for centuries what the factory and the storehouse have only recently become in an era of industrialism. For the ancients, the problems of wealth—its acquisition, accumulation, and use—were domestic, not political. "The so-called art of getting wealth," Aristotle writes, is "according to some . . . identical with household management, according to others, a principal part of it." In his own judgment, "property is a part of the household, and the art of acquiring property is a part of the art of managing the household"—but a *part only*, because the household includes human beings as well as property, and is concerned with the government of persons as well as the management of things.

The foregoing throws light on the extraordinary shift in the meaning of the word "economics" from ancient to modern times. In the significance of their Greek roots, the word "polity" signifies a state, the word "economy" a family; and as "politics" referred to the art of governing the political community, so "economics" referred to the art of governing the domestic community. Only in part was it concerned with the art of getting wealth. As the chapter on WEALTH indicates, Rousseau tries to preserve the broader meaning when he uses the phrase "political economy" for the general problems of government; but for the most part in modern usage "economics" refers to a science or art concerned with wealth, and it is "political" in the sense that the management of wealth, and of men with respect to wealth, has become the problem of the state rather than the family. Not only has the industrial economy become more and more a political affair, but the character of the family as a social institution has also changed with its altered economic status and function.

THE CHIEF QUESTION about the family in relation to the state has been, in ancient as well as in modern times, whether the family has natural rights which the state cannot justly invade or transgress.

The proposal in Plato's *Republic*—"that the wives of our guardians are to be common, and their children are to be common, and no parent is to know his own child, nor any child his parent"—was as radical in the fifth century

B.C. as its counterpart would be today. When Socrates proposes this, Glaucon suggests that "the possibility as well as the utility of such a law" may be subject to "a good many doubts." But Socrates does not think that "there can be any dispute about the very great utility of having wives and children in common; the possibility," he adds, "is quite another matter, and will be very much disputed."

Aristotle questions both the desirability and possibility. "The premise from which the argument of Socrates proceeds," he says, is "'the greater the unity of the state the better.'" He denies this premise. "Is it not obvious," he asks, "that a state may at length attain such a degree of unity as to be no longer a state?—since the nature of a state is to be a plurality, and in tending to a greater unity, from being a state, it becomes a family, and from being a family, an individual." Hence "we ought not to attain this greatest unity even if we could, for it would be the destruction of the state." In addition, "the scheme, taken literally, is impracticable."

It is significant that Aristotle's main argument against Plato's "communism" (which includes the community of property as well as the community of women and children) is based upon the nature of the state rather than on the rights of the family. It seems to have been a prevalent view in antiquity, at least among philosophers, that the children should be "regarded as belonging to the state rather than to their parents." Antigone's example shows, however, that this view was by no means without exception. Her defiance of Creon, based on "the unwritten and unfailing statutes of heaven," is also undertaken for "the majesty of kindred blood." In this sense, it constitutes an affirmation of the rights and duties of the family.

In the Christian tradition the rights of the family as against the state are also defended by reference to divine law. The point is not that the state is less a natural community than the family in the eyes of a theologian like Aquinas; but in addition to having a certain priority in the order of nature, the family, more directly than the state, is of divine origin. Not only is it founded on the sacrament of matrimony, but the express commandments of God dictate the

duties of care and obedience which bind its members together. For the state to interfere in those relationships between parents and children or between husband and wife which fall under the regulation of divine law would be to exceed its authority, and hence to act without right and in violation of rights founded upon a higher authority.

In the Christian tradition philosophers like Hobbes and Kant state the rights of the family in terms of natural law or defend them as natural rights. "Because the first instruction of children," writes Hobbes, "depends on the care of their parents, it is necessary that they should be obedient to them while they are under their tuition. . . . Originally the father of every man was also his sovereign lord, with power over him of life and death." When the fathers of families relinquished such absolute power in order to form a commonwealth or state, they did not lose, nor did they have to give up, according to Hobbes, all control of their children. "Nor would there be any reason," he goes on, "why any man should desire to have children, or take the care to nourish and instruct them, if they were afterwards to have no other benefit from them than from other men. And this," he says, "accords with the Fifth Commandment."

In the section of his *Science of Right* devoted to the "rights of the family as a domestic society," Kant argues that "from the fact of procreation there follows the duty of preserving and rearing children." From this duty he derives "the right of parents to the management and training of the child, so long as it is itself incapable of making proper use of its body as an organism, and of its mind as an understanding. This includes its nourishment and the care of its education." It also "includes, in general, the function of forming and developing it practically, that it may be able in the future to maintain and advance itself, and also its moral culture and development, the guilt of neglecting it falling upon the parents."

As is evident from Hobbes and Kant, the rights of the family can be vindicated without denying that the family, like the individual, owes obedience to the state. In modern terms, at least, the problem is partly stated by the question, To what extent can parents justly claim exemption from political interference in

the control of their own children? But this is only part of the problem. It must also be asked whether, in addition to regulating the family for the general welfare of the whole community, the state is also entitled to interfere in the affairs of the household in order to protect children from parental mismanagement or neglect. Both questions call for a consideration of the form and principles of domestic government.

THE KINDS OF RULE and the relation between ruler and ruled in the domestic community have a profound bearing on the theory of government in the larger community of the state. Many of the chapters on the forms of government—especially CONSTITUTION, MONARCHY, and TYRANNY—indicate that the great books of political theory, from Plato and Aristotle to Locke and Rousseau, derive critical points from the comparison of domestic and political government.

We shall pass over the master-slave relationship, both because that is considered in the chapter on SLAVERY, and because not all households include human chattel. Omitting this, two fundamental relationships which domestic government involves remain to be examined: the relation of husband and wife, and of parents and children.

With regard to the first, there are questions of equality and administrative supremacy. Even when the wife is regarded as the complete equal of her husband, the administrative question remains, for there must either be a division of authority, or unanimity must prevail, or one—either the husband or the wife—must have the last word when disagreement must be overcome to get any practical matter decided. So far as husband and wife are concerned, should the family be an absolute monarchy, or a kind of constitutional government?

Both an ancient and a modern writer appear to answer this question in the same way. "A husband and father," Aristotle says, "rules over wife and children, both free, but the rule differs, the rule over his children being a royal, over his wife a constitutional rule." Yet the relation between husband and wife, in Aristotle's view, is not perfectly constitutional. In the state "the citizens rule and are ruled in turn"

on the supposition that their "natures . . . are equal and do not differ at all." In the family, however, Aristotle thinks that "although there may be exceptions to the order of nature, the male is by nature fitter for command than the female."

According to Locke, "the husband and wife, though they have but one common concern, yet having different understandings, will unavoidably sometimes have different wills too. It therefore being necessary that the last determination (*i.e.*, the rule) should be placed somewhere, it naturally falls to the man's share as the abler and the stronger." But this, Locke thinks, "leaves the wife in the full and true possession of what by contract is her peculiar right, and at least gives the husband no more power over her than she has over his life; the power of the husband being so far from that of an absolute monarch that the wife has, in many cases, a liberty to separate from him where natural right or their contract allows it."

In the so-called Marriage Group of the *Canterbury Tales*, Chaucer gives voice to all of the possible positions that have ever been taken concerning the relation of husband and wife. The Wife of Bath, for example, argues for the rule of the wife. She claims that nothing will satisfy women until they "have the sovereignty as well upon their husband as their love, and to have mastery their man above." The Clerk of Oxford, in his tale of patient Griselda, presents the wife who freely admits to her husband, "When first I came to you, just so left I my will and all my liberty." The Franklin in his tale allows the mastery to neither wife nor husband, "save that the name and show of sovereignty" would belong to the latter. He dares to say

That friends each one the other must obey
If they'd be friends and long keep company.
Love will not be constrained by mastery; . . .
Women by nature love their liberty,
And not to be constrained like any thrall,
And so do men, if say the truth I shall. . . .
Thus did she take her servant and her lord,
Servant in love and lord in their marriage;
So was he both in lordship and bondage.

WHILE THERE MAY be disagreement regarding the relation between husband and wife, there is none regarding the inequality between parents and children during the offspring's imma-

turity. Although every man may enjoy "equal right . . . to his natural freedom, without being subjected to the will or authority of any other men," children, according to Locke, "are not born in this full state of equality, though they are born to it."

Paternal power, even absolute rule, over children arises from this fact. So long as the child "is in an estate wherein he has no understanding of his own to direct his will," Locke thinks he "is not to have any will of his own to follow. He that understands for him must will for him too; he must prescribe to his will, and regulate his actions." But Locke adds the important qualification that when the son "comes to the estate which made his father a free man, the son is a free man too."

Because children are truly inferior in competence, there would seem to be no injustice in their being ruled by their parents; or in the rule being absolute in the sense that children are precluded from exercising a decisive voice in the conduct of their own or their family's affairs. Those who think that kings cannot claim the absolute authority of parental rule frequently use the word "despotic" to signify unjustified paternalism—a transference to the state of a type of dominion which can be justified only in the family.

The nature of despotism as absolute rule is discussed in the chapters on MONARCHY and TYRANNY, but its relevance here makes it worth repeating that the Greek word from which "despot" comes, like its Latin equivalent *paterfamilias*, signifies the ruler of a household and carries the connotation of absolute rule—the complete mastery of the father over the children and the servants, if not over the wife. Accordingly there would seem to be nothing invidious in referring to domestic government as despotic, at least not to the extent that, in the case of the children, absolute rule is justified by their immaturity. The problem arises only with respect to despotism in the state, when one man rules another mature man as absolutely as a parent rules a child.

The great defender of the doctrine that the sovereign must be absolute, "or else there is no sovereignty at all," sees no difference between the rights of the ruler of a state—the "sovereign by institution"—and those of a father as the

natural master of his family. "The rights and consequences of both paternal and despotical dominion," Hobbes maintains, "are the very same with those of a sovereign by institution." On the other hand, Rousseau, an equally staunch opponent of absolute rule, uses the word "despotism" only in an invidious sense for what he regards as illegitimate government—absolute monarchy. "Even if there were as close an analogy as many authors maintain between the State and the family," he writes, "it would not follow that the rules of conduct proper for one of these societies would be also proper for the other."

Rousseau even goes so far as to deny that parental rule is despotic in his sense of that term. "With regard to paternal authority, from which some writers have derived absolute government," he remarks that "nothing can be further from the ferocious spirit of despotism than the mildness of that authority which looks more to the advantage of him who obeys than to that of him who commands." He agrees with Locke in the observation that, unlike the political despot, "the father is the child's master no longer than his help is necessary." When both are equal, the son is perfectly independent of the father, and owes him "only respect and not obedience."

Misrule in the family, then, would seem to occur when these conditions or limits are violated. Parents may try to continue their absolute control past the point at which the children have become mature and are competent to take care of their own affairs. A parent who does not relinquish his absolutism at this point can be called "despotic" in the derogatory sense of that word.

Applying a distinction made by some political writers, the parent is tyrannical rather than despotic when he uses the children for his own good, treats them as property to exploit, even at a time when his absolute direction of their affairs would be justified if it were for the children's welfare. The existence of parental tyranny raises in its sharpest form the question of the state's right to intervene in the family for the good of its members.

THE CENTRAL ELEMENT in the domestic establishment is, of course, the institution of mar-

riage. The discussion of marriage in the great books deals with most of the moral and psychological, if not all of the sociological and economic, aspects of the institution. The most profound question, perhaps, is whether marriage is merely a human institution to be regulated solely by custom and civil law, or a contract under the sanctions of natural law, or a religious sacrament signifying and imparting God's grace. The last two of these alternatives may not exclude one another, but those who insist upon the first usually reject the other two.

Some, like the Parson in the *Canterbury Tales*, consider marriage not only a natural but also a divine institution—a "sacrament . . . ordained by God Himself in Paradise, and confirmed by Jesus Christ, as witness St. Matthew in the gospel: 'For this cause shall a man leave father and mother, and shall cleave to his wife; and they twain shall be one flesh,' which betokens the knitting together of Christ and of Holy Church."

Others, like Kant, seem to stress the character of marriage as an institution sanctioned by natural law. The "natural union of the sexes," he writes, "proceeds either according to the mere animal nature (*vaga libido, venus vulgivaga, fornicatio*), or according to law. The latter is marriage (*matrimonium*), which is the union of two persons of different sex for life-long reciprocal possession of their sexual faculties." Kant considers offspring as a natural end of marriage, but not the exclusive end, for then "the marriage would be dissolved of itself when the production of children ceased. . . . Even assuming," he declares, "that enjoyment in the reciprocal use of the sexual endowments is an end of marriage, yet the contract of marriage is not on that account a matter of arbitrary will, but is a contract necessary in its nature by the Law of Humanity. In other words, if a man and a woman have the will to enter on reciprocal enjoyment in accordance with their sexual natures, they *must* necessarily marry each other."

Still others see marriage primarily as a civil contract. Freud, for example, considers the view that "sexual relations are permitted only on the basis of a final, indissoluble bond between a man and woman" as purely a convention of "present-day civilization." Marriage, as a set of taboos restricting the sexual life, varies from

culture to culture; but in Freud's opinion the "high-water mark in this type of development has been reached in our Western European civilization."

The conception of marriage—whether it is merely a civil, or a natural, and even a divine institution—obviously affects the position to be taken on monogamy, on divorce, on chastity and adultery, and on the comparative merits of the married and the celibate condition. The pagans, for the most part, regard celibacy as a misfortune, especially for women, as witness the tragedy of the unwedded Electra. Christianity, on the other hand, celebrates the heroism of virginity and encourages the formation of monastic communities for celibates. Within the Judaeo-Christian tradition there are striking differences. Not only were the patriarchs of the Old Testament polygamous, but orthodox Judaism and orthodox Christianity also differ on divorce.

Augustine explains how a Christian should interpret those passages in the Old Testament which describe the polygamous practices of the patriarchs. "The saints of ancient times," he writes, "were under the form of an earthly kingdom, foreshadowing and foretelling the kingdom of heaven. And on account of the necessity for a numerous offspring, the custom of one man having several wives was at that time blameless; and for the same reason it was not proper for one woman to have several husbands, because a woman does not in that way become more fruitful . . . In regard to matters of this sort," he concludes, "whatever the holy men of those times did without lust, Scripture passes over without blame, although they did things which could not be done at the present time except through lust."

On similar grounds Aquinas holds that "it was allowable to give a bill of divorce," under the law of the Old Testament, but it is not allowable under the Christian dispensation because divorce "is contrary to the nature of a sacrament." The greatest familiarity between man and wife requires the staunchest fidelity which "is impossible if the marriage bond can be sundered." Within the Christian tradition Locke takes an opposite view of divorce. He can see good reason why "the society of man and wife should be more lasting than that of

male and female amongst other creatures," but he does not see "why this compact, where procreation and education are secured, and inheritance taken care for, may not be made determinable either by consent, or at a certain time, or upon certain conditions, as well as any other voluntary compact, there being no necessity in the nature of the thing . . . that it should always be for life." Against Locke, Dr. Johnson would argue that "to the contract of marriage, besides the man and wife, there is a third party—Society; and if it be considered as a vow—God; and therefore it cannot be dissolved by their consent alone."

Laws and customs, however, represent only the external or social aspect of marriage. The discussion of these externals cannot give any impression of the inwardness and depth of the problem which marriage is for the individual person. Only the great poems, the great novels and plays, the great books of history and biography can adequately present the psychological and emotional aspects of marriage in the life of individuals. Heightened in narration, they give more eloquent testimony than the case histories of Freud to support the proposition that marriage is at all times—in every culture and under the widest variety of circumstances—one of the supreme tests of human character.

The relation between men and women in and out of marriage, the relation of husband and wife before and after marriage, the relation of parents and children—these create crises and tensions, conflicts between love and duty, between reason and the passions, from which no individual can entirely escape. Marriage is not only a typically human problem, but it is the one problem which, both psychologically and morally, touches every man, woman, and child. Sometimes the resolution is tragic, sometimes the outcome seems to be happy, almost blessed; but whether a human life is built on this foundation or broken against these rocks, it is violently shaken in the process and forever shaped.

To some degree each reader of the great books has, in imagination if not in action, participated in the trials of Odysseus, Penelope, and Telemachus; in the affections of Hector and Andromache, Alcestis and Admetus, Tom Jones and Sophia, Natasha and Pierre Bezúkhov, in the jealousy of Othello, the anguish of Lear,

the decision of Aeneas or the indecision of Hamlet; and certainly in the reasoning of Panurge about whether to marry or not. In each of these cases, everyone finds some aspect of love in relation to marriage, some phase of parenthood or childhood which has colored his own life or that of his family; and he can find somewhere in his own experience the grounds for sympathetic understanding of the extraordinary relation between Electra and her mother Clytemnestra, between Augustine and Monica his mother, between Oedipus and Jocasta, Prince Hamlet and Queen Gertrude, Pierre Bezúkhov and his wife, or what is perhaps the most extraordinary case of all—Adam and Eve in *Paradise Lost*.

On one point the universality of the problem of marriage and family life seems to require qualification. The conflict between conjugal and illicit love exists in all ages. The entanglement of the bond between man and wife with the ties—of both love and blood—which unite parents and children, is equally universal. But the difficulties which arise in marriage as a result of the ideals or the illusions of romantic love seem to constitute a peculiarly modern problem. The ancients distinguished between sexual love and the love of friendship and they understood the necessity for both in the conjugal relationship if marriage is to prosper. But not until the later Middle Ages did men think of matrimony as a way to perpetuate throughout all the years the ardor of that moment in a romantic attachment when the lovers find each other without flaw and beyond reproach.

Matters relevant to this modern problem are discussed in the chapter on LOVE. As is there indicated, romantic love, though it seems to be of Christian origin, may also be a distortion—even an heretical perversion—of the kind of Christian love which is pledged in the reciprocal vows of holy matrimony.

WE HAVE ALREADY considered some of the problems of the family which relate to children and youth—the immature members of the human race—such as whether the child *belongs* to the family or the state, and whether the family is solely responsible for the care and training of children, or a share of this responsibility falls to the state or the church.

There are other problems. Why do men and women want offspring and what satisfactions do they get from rearing children? For the most part in Christendom, and certainly in antiquity, the lot of the childless is looked upon as a grievous frustration. To be childless is not merely contrary to nature, but for pagan as well as Christian it constitutes the deprivation of a blessing which should grace the declining years of married life. The opposite view, so rarely taken, is voiced by the chorus of women in the *Medea* of Euripides.

"Those who are wholly without experience and have never had children far surpass in happiness those who are parents," the women chant in response to *Medea's* tragic leave-taking from her own babes. "The childless, because they have never proved whether children grow up to be a blessing or a curse to men, are removed from all share in many troubles; whilst those who have a sweet race of children growing up in their houses do wear away . . . their whole life through; first with the thought how they may train them up in virtue, next how they shall leave their sons the means to live; and after all this 'tis far from clear whether on good or bad children they bestow their toil."

Still other questions arise concerning children, quite apart from the attitude of parents toward having and rearing them. What is the economic position of the child, both with respect to ownership of property and with respect to a part in the division of labor? How has the economic status of children been affected by industrialism? What are the mental and moral characteristics of the immature which exclude them from participation in political life, and which require adult regulation of their affairs? What are the criteria—emotional and mental as well as chronological—which determine the classification of individuals as children or adults, and how is the transition from childhood to manhood effected economically, politically, and above all emotionally?

The authors of the great books discuss most of these questions, but among them only Freud sees in the relation of children to their parents the basic emotional determination of human life. The fundamental triangle of love and hate, devotion and rivalry, consists of father, mother, and child. For Freud all the intricacies and per-

versions of love, the qualitative distinctions of romantic, conjugal, and illicit love, the factors which determine the choice of a mate and success or failure in marriage, and the conditions which determine the emergence from emotional infantilism—all these can be understood only by reference to the emotional life of the child in the vortex of the family.

The child's "great task," according to Freud, is that of "freeing himself from the parents," for "only after this detachment is accomplished can he cease to be a child and so become a member of the social community. . . . These tasks are laid down for every man" but, Freud writes, "it is noteworthy how seldom they are carried through ideally, that is, how seldom they are solved in a manner psychologically as well as socially satisfactory. In neurotics, however," he adds, "this detachment from the parents is not accomplished at all."

In one sense, it is never fully accomplished by anyone. What Freud calls the "ego-ideal"—which represents our higher nature and which, in the name of the reality-principle, resists instinctual compliance with the pleasure-principle—is said to have its origin in "the identification with the father, which takes place in the prehistory of every person." Even after an individual has achieved detachment from the family, this ego-ideal acts as "a substitute for the longing for a father"; and in the form of conscience it "continues . . . to exercise the censorship of morals."

ONE OTHER GROUP of questions which involve the family—at least as background—concerns the position or role of women. We have already considered their relation to their husbands in the government of the family itself. The way in which that relation is conceived affects the status and activity of women in the larger community of the state, in relation to citizenship and the opportunities for education, to the possession of property and the production of wealth (for example, the role of female labor in an industrial economy).

Again it is Euripides who gives voice to the plight of women in a man's world, in two of his great tragedies, the *Trojan Women* and *Medea*. In the one, they cry out under the brunt of the suffering which men leave them to bear in the

backwash of war. In the other, Medea passionately berates the ignominy and bondage which women must accept in being wives. "Of all things that have life and sense," she says, "we women are the most hapless creatures; first must we buy a husband at great price, and then o'er ourselves a tyrant set, which is an evil worse than the first."

The ancient world contains another feminist who goes further than Euripides in speaking for the right of women to be educated like men, to share in property with them, and to enjoy the privileges as well as to discharge the tasks of citizenship. In the tradition of the great books, the striking fact is that after Plato the next great declaration of the rights of women should be written by one who is as far removed from him in time and temper as John Stuart Mill.

In Plato's *Republic*, Socrates argues that if the difference between men and women "consists only in women bearing and men begetting children, this does not amount to proof that a woman differs from a man in respect to the sort of education she should receive." For the same reason, he says, "the guardians and their wives ought to have the same pursuits." Since he thinks that "the gifts of nature are alike diffused in both," Socrates insists that "there is no special faculty of administration in a state which a woman has because she is a woman, or which a man has by virtue of his sex. All the pursuits of men are the pursuits of women also." Yet he adds that "in all of them a woman is inferior to a man." Therefore when he proposes to let women "share in the toils of war and the defence of their country," Socrates suggests that "in the distribution of labors the lighter are to be assigned to the women, who are the weaker natures."

Mill's tract on *The Subjection of Women* is his fullest statement of the case for social, economic, and political equality between the sexes. In *Representative Government*, his defense of women's rights deals primarily with the question of extending the franchise to them. Difference of sex, he contends, is "as entirely irrelevant to political rights, as difference in height, or in the color of the hair. All human beings have the same interest in good government . . . Mankind have long since abandoned the only premisses which will support the conclusion that women ought not to have votes. No one now holds that women should be in personal servitude; that they should have no thought, wish, or occupation, but to be the domestic drudges of husbands, fathers, or brothers. It is allowed to unmarried, and wants but little of being conceded to married women to hold property, and have pecuniary and business interests, in the same manner as men. It is considered suitable and proper that women should think, and write, and be teachers. As soon as these things are admitted," Mill concludes, "the political disqualification has no principle to rest on."

Though no other of the great books speaks so directly for the emancipation of women from domestic and political subjection, many of them do consider the differences between men and women in relation to war and love, pleasure and pain, virtue and vice, duty and honor. Some are concerned explicitly with the pivotal question—whether men and women are more alike than different, whether they are essentially equal in their humanity or unequal. Since these are matters pertinent to human nature itself, as it is affected by gender, the relevant passages are collected in the chapter on MAN.

OUTLINE OF TOPICS

	PAGE
1. The nature and necessity of the family	497
2. The family and the state	
2a. Comparison of the domestic and political community in origin, structure, and function	
2b. Comparison of the domestic and political community in manner of government	498
2c. The place and rights of the family in the state: the control and education of children	

3. The economics of the family	499
3a. The wealth of families: the maintenance of the domestic economy	
3b. The effects of political economy: the family in the industrial system	
4. The institution of marriage: its nature and purpose	
4a. Monogamy and polygamy	500
4b. The religious view of marriage: the sacrament of matrimony	
4c. Matrimony and celibacy	501
4d. The laws and customs regulating marriage: adultery, incest	
4e. Divorce	502
5. The position of women	503
5a. The role of women in the family: the relation of husband and wife in domestic government	
5b. The status of women in the state: the right to citizenship, property, education	504
5c. Women in relation to war	
6. Parents and children: fatherhood, motherhood	505
6a. The desire for offspring	
6b. Eugenics: control of breeding; birth control	506
6c. The condition of immaturity	
6d. The care and government of children: the rights and duties of the child; parental despotism and tyranny	507
6e. The initiation of children into adult life	508
7. The life of the family	
7a. Marriage and love: romantic, conjugal, and illicit love	
7b. The continuity of the family: the veneration of ancestors; family pride, feuds, curses	509
7c. Patterns of friendship in the family: man and wife; parents and children; brothers and sisters	510
7d. The emotional impact of family life upon the child: the domestic triangle; the symbolic roles of father and mother	511
8. Historical observations on the institution of marriage and the family	512

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 27: FATE

INTRODUCTION

FATE—sometimes personified, sometimes abstractly conceived—is the antagonist of freedom in the drama of human life and history. So at least it seems to the poets of antiquity. In many of the Greek tragedies, fate sets the stage. Some curse must be fulfilled. A doom impends and is inexorable. But the actors on the stage are far from puppets. Within the framework of the inevitable the tragic hero works out his own destiny, making the choices from which his personal catastrophe ensues. Oedipus, doomed to kill his father and marry his mother, is not fated to inquire into his past and to discover the sins which, when he sees, he wills to see no more. The curse on the house of Atreus does not require Agamemnon to bring Cassandra back from Troy or to step on the purple carpet. The furies which pursue Orestes he has himself awakened by murdering his mother, Clytemnestra, a deed not fated but freely undertaken to avenge his father's death.

The ancients did not doubt that men could choose and, through choice, exercise some control over the disposition of their lives. Tacitus, for example, while admitting that "most men . . . cannot part with the belief that each person's future is fixed from his very birth," claims that "the wisest of the ancients . . . leave us the capacity of choosing our life." At the same time he recognizes an order of events beyond man's power to control, although he finds no agreement regarding its cause—whether it depends "on wandering stars" or "primary elements, and on a combination of natural causes." For his own part, Tacitus declares, "I suspend my judgment" on the question "whether it is fate and unchangeable necessity or chance which governs the revolutions of human affairs." In so doing, he grants the possibility that not everything which lies beyond man's control is fated. Some of the things which happen with-

out man's willing them may happen by chance or fortune.

It is sometimes supposed that "fate" and "fortune" are synonyms, or that one has a tragic and the other a happy connotation. It is as if fortune were always good and fate always malevolent. But either may be good or evil from the point of view of man's desires. Although fate and fortune are hardly the same, there is some reason for associating them. Each imposes a limitation on man's freedom. A man cannot compel fortune to smile upon him any more than he can avoid his fate. Though alike in this respect, fate and fortune are also opposed to one another. Fate represents the inexorable march of events. There is no room for fortune unless some things are exempt from necessity. Only that which can happen by chance is in the lap of fortune.

It would seem that fate stands to fortune as the necessary to the contingent. If everything were necessitated, fate alone would reign. Contingency would be excluded from nature. Chance or the fortuitous in the order of nature and freedom in human life would be reduced to illusions men cherish only through ignorance of the inevitable.

In a sense fortune is the ally of freedom in the struggle against fate. Good fortune seems to aid and abet human desires. But even misfortune signifies the element of chance which is more congenial than fate, if not more amenable, to man's conceit that he can freely plan his life.

THE TERMS *necessity* and *contingency* cannot be substituted for *fate* and *fortune* without loss of significance. As the chapter on NECESSITY AND CONTINGENCY indicates, they are terms in the philosophical analysis of the order of nature and causality. They may have, but they need not have, theological implications. Necessity

and contingency can be explained without any reference to the supernatural, as is evident from the discussion of these matters in the chapter on CHANCE. But fate and fortune, in their origin at least, are theological terms.

In ancient poetry and mythology, both inevitability and chance were personified as deities or supernatural forces. There were the goddess of Fortune and the three Fates, as well as their three evil sisters or counterparts, the Furies. The Latin word from which "fate" comes means an oracle, and so signifies what is divinely ordained. What happens by fate is *fated*—something destined and decreed in the councils of the gods on Olympus; or it may be the decision of Zeus, to whose rule all the other divinities are subject; or, as we shall see presently, it may be a supernatural destiny which even Zeus cannot set aside.

In any case, the notion of fate implies a supernatural will, even as destiny implies predestination by an intelligence able not only to plan the future but also to carry out that plan. The inevitability of fate and destiny is thus distinguished from that of merely natural necessity, which determines the future only insofar as it may be the inevitable consequence of causes working naturally.

But the ancients do not seem to be fatalists in the extreme sense of the term. To the extent that men can propitiate the gods or provoke divine jealousy and anger, the attitudes and deeds of men seem to be a determining factor in the actions of the gods. To the extent that the gods align themselves on opposite sides of a human conflict (as in the *Iliad*), or oppose each other (as in the *Odyssey*), it may be thought that what happens on earth merely reflects the shifting balance of power among the gods.

But human planning and willing do not seem to be excluded by the divine will and plan which are forged out of the quarrels of the gods. On the contrary, polytheism seems to make fortune itself contingent on the outcome of the Olympian conflict, and so permits men a certain latitude of self-determination. Men can struggle against the gods precisely because the gods may be with them as well as against them.

The ultimate power of Zeus to decide the issue may, however, place the accent on fate

rather than on freedom. This is certainly so if Zeus is not the master of even his own fate, much less the omnipotent ruler among the gods or the arbiter of human destiny. In *Prometheus Bound*, the Chorus asks, "Who is the pilot of Necessity?" Prometheus answers, "The Fates triiform and the unforgetting Furies." The Chorus then asks, "Is Zeus of lesser might than these?" To which Prometheus replies, "He shall not shun the lot apportioned." When they ask what this doom is, Prometheus tells them to inquire no more, for they verge on mysteries. Later Zeus himself sends Hermes to wrest from Prometheus the secret of what has been ordained for him by "all consummating Fate" or "Fate's resistless law." Prometheus refuses, saying that "none shall bend my will or force me to disclose by whom 'tis fated he shall fall from power."

The question Aeschylus leaves unanswered is whether Zeus would be able to escape his doom if he could foresee what Fate holds in store for him. The suggestion seems to be that without omniscience the omnipotence of Zeus cannot break the chains of Fate.

IN THE TRADITION of Judaeo-Christian theology the problem of fate is in part verbal and in part real. The verbal aspect of the problem concerns the meaning of the word "fate" in relation to the divine will, providence, and predestination. With the verbal matter settled, there remains the real problem of God's will and human freedom. The strictly monotheistic conception of an omnipotent and omniscient God deepens the mystery, and makes it more difficult than the problem of fate and freedom in pagan thought.

If anyone "calls the will or the power of God itself by the name of fate," Augustine says, "let him keep his opinion, but correct his language. . . . For when men hear that word, according to the ordinary use of language, they simply understand by it the virtue of that particular position of the stars which may exist at the time when anyone is born or conceived, which some separate altogether from the will of God, whilst others affirm that this also is dependent on that will. But those who are of the opinion that, apart from the will of God, the stars determine what we shall do, or what

good things we shall possess, or what evils we shall suffer, must be refused a hearing by all, not only by those who hold the true religion, but by those who wish to be the worshippers of any gods whatsoever, even false gods. For what does this opinion really amount to but this, that no god whatsoever is to be worshipped or prayed to?"

Since the word "fate" has been used for those things which are determined apart from the will of God or man, Augustine thinks it would be better for Christians not to use it, but to substitute "providence" or "predestination" when they wish to refer to what God wills. Aquinas, however, retains the word "fate" but restricts its meaning to the "ordering . . . of mediate causes" by which God wills "the production of certain effects."

According to the definition given by Boethius which Aquinas quotes, "Fate is a disposition inherent to changeable things, by which providence connects each one with its proper order." Thus fate is not identified with providence, but made subordinate to it. The distinction, Aquinas explains, depends on the way we consider "the ordering of effects" by God. "As being in God Himself . . . the ordering of the effects is called Providence." But "as being in the mediate causes ordered by God," it is called fate. While admitting that "the divine power or will can be called fate, as being the cause of fate," he declares that "essentially fate is the very disposition or *series*, i.e., order, of second causes."

The position Lucretius takes seems to be exactly opposite to that of Augustine and Aquinas. Lucretius condemns the fatalism of those who believe that the gods control the order of nature and who therefore attribute whatever befalls them to divine ordination. For him, "nature free at once and rid of her haughty lords is seen to do all things spontaneously of herself without the meddling of the gods." He tries to teach men that everything happens according to the laws of nature, *other than which there is no fate*. The "decrees of fate" lie in the laws by which "all motion is ever linked together and a new motion ever springs from another in a fixed order." If man by his "power of free action" can "make some commencement of motion to break through the decrees

of fate, in order that cause follow not cause from everlasting," it is because in the atoms of his makeup "there is another cause of motions . . . caused by a minute swerving of first-beginnings at no fixed part of space and no fixed time."

Nevertheless, according to Augustine, Lucretius is a fatalist who disbelieves in providence, *other than which there is no fate*. Each of them uses the word "fate," the one to deny, the other to affirm, the power of God.

But even if a Christian avoids the superstitions of astrology, or some similar belief in a natural necessity which does not depend on God, he may still commit the sin of fatalism which follows from the denial of man's free will. Understanding fate as identical with providence, the Christian is a fatalist if, in the belief that every human act is foreordained by God, he resigns himself to his fate, making no moral effort and taking no moral responsibility for his soul's welfare. To do that is to argue like Chaucer's Troilus:

I am, he said, but done for, so to say;
For all that comes, comes by necessity,
Thus to be done for is my destiny.
I must believe and cannot other choose,
That Providence, in its divine foresight,
Hath known that Cressida I once must lose,
Since God sees everything from heaven's height
And plans things as he thinks both best and right,
As was arranged for by predestination.

Troilus sees no way of avoiding the conclusion that "free choice is an idle dream."

THE THEOLOGIANS recognize the difficulty of reconciling providence and free will. The truth must lie somewhere between two heresies. If it is heresy to deny God's omnipotence and omniscience, then nothing remains outside the all-encompassing scope of divine providence, nothing happens contrary to the divine will, no future contingency is or can be unforeseen by God. If, on the other hand, to deny that man sins freely means that God must be responsible for the evil that man does, then it is a heresy to deny free will, for that imputes evil to God.

This is the problem with which Milton deals in *Paradise Lost*, announcing that he will try "to justify the ways of God to man." In a conversation in heaven, the Father tells the

Son that though He knows Adam will disobey his rule, Adam remains quite free to sin or not to sin, and the fault is his own, just as the rebellious angels acted on their own free will. The angels, God says,

So were created, nor can justly accuse
Thir maker, or thir making, or thir Fate;
As if Predestination over-rul'd
Thir will, dispos'd by absolute Decree
Or high foreknowledge; they themselves decreed
Thir own revolt, not I: if I foreknew,
Foreknowledge had no influence on their fault,
Which had no less prov'd certain unforeknown.
So without least impulse or shadow of Fate,
Or ought by me immutable foreseen,
They trespass, Authors to themselves in all,
Both what they judge and what they choose; for so
I formed them free, and free they must remain,
Till they enthrall themselves: I else must change
Thir nature, and revoke the high Decree
Unchangeable, Eternal, which ordain'd
Thir freedom, they themselves ordain'd their fall.

A solution of the problem is sometimes developed from the distinction between God's foreknowledge and God's foreordination. God foreordained the freedom of man, but only foreknew his fall; man ordained that himself. Strictly speaking, however, the word "foreknowledge" would seem to carry a false connotation, since nothing is future to God. Everything that has ever happened or ever will is simultaneously together in the eternal present of the divine vision.

During his ascent through Paradise, Dante, wishing to learn about his immediate future, asks his ancestor Cacciaguida to foretell his fortune, for he, "gazing upon the Point to which all times are present, can see contingent things, ere in themselves they are." Cacciaguida prefaces his prediction of Dante's exile from Florence by telling him that the contingency of material things "is all depicted in the Eternal Vision; yet thence it does not take necessity, more than does a ship which is going down the stream from the eye in which it is mirrored." The difference between time and eternity is conceived as permitting the temporal future to be contingent even though God knows its content with certitude.

But, it may still be asked, does not God's knowledge imply the absolute predestination of future events by providence, since what God knows with certitude cannot happen otherwise

than as He knows it? In a discussion of divine grace and man's free will, Dr. Johnson remarks, "I can judge with great probability how a man will act in any case, without his being restrained by my judging. God may have this probability increased to certainty." To which Boswell replies that "when it is increased to *certainty*, freedom ceases, because that cannot be certainly foreknown, which is not certain at the time; but if it be certain at the time, it is a contradiction to maintain that there can be afterwards any contingency dependent upon the exercise of will or anything else."

Against such difficulties Aquinas insists that divine providence is compatible, not only with natural necessity, but also with contingency in nature and free will in human acts. Providence, he writes, "has prepared for some things necessary causes so that they happen of necessity; for others contingent causes, that they may happen by contingency." Human liberty does not imply that the will's acts are not caused by God who, being the first cause, "moves causes both natural and voluntary. Just as by moving natural causes, He does not prevent their acts being natural, so by moving voluntary causes, He does not deprive their actions of being voluntary." God causes man to choose freely and freely to execute his choice.

THE UNCOMPROMISING conception of fate is that which leaves no place for chance or freedom anywhere in the universe, neither in the acts of God, nor in the order of nature, nor in the course of history. The doctrine of absolute determinism, whether in theology, science, or history, is thus fatalism unqualified.

The ancient historians are not fatalists in this sense. Herodotus, for example, finds much that can be explained by the contingencies of fortune or by the choices of men. The crucial decision, for example, in the defense of Athens is presented as an act of man's choice. Upon receiving the prophecy that "safe shall the wooden wall continue for thee and thy children," the Athenians exercise their freedom by disagreeing about its meaning. "Certain of the old men," Herodotus writes, "were of the opinion that the god meant to tell them the citadel would escape; for this was anciently defended by a palisade. . . . Others maintained

that the fleet was what the god pointed at; and their advice was that nothing should be thought of except the ships." The eloquence of Themistocles carried the latter view. To stress its importance, the historian observes that "the saving of Greece" lay in the decision that led Athens to "become a maritime power."

In presenting a comparable decision by the Persians, Herodotus seems to be contrasting their fatalism with the freedom of the Greeks. At first Xerxes accepts the council of Artabanus not to go to war against the Greeks. But after a series of visions, which appear to both the king and his councillor, that decision is reversed, for, according to the dream, the war "is fated to happen."

The conception of fate and freedom in the *Aeneid* seems closer to the Greek than to the Persian view. Even though the consummation of history, which will come with the founding of the Roman empire, is projected as a divinely appointed destiny, the hero who brings that great event to pass acts as if he were free to accept or evade his responsibilities.

The Christian understanding of historical destiny in terms of providence permits—more than that, requires—men to exercise free choice at every turn. "The cause of the greatness of the Roman empire," writes Augustine, "is neither fortuitous nor fatal, according to the judgment or opinion of those who call those things *fortuitous* which either have no causes or such causes as do not proceed from some intelligible order, and those things *fatal* which happen independently of the will of God and man, by the necessity of a certain *order*. . . . Human kingdoms are established by divine providence." The fatalism which Augustine here condemns involves independence not only of the will of God, but of man's will also.

It is only in modern times, with Hegel and Marx, that necessity reigns supreme in the philosophy of history. Hegel spurns the notion that history is "a superficial play of casual, so-called 'merely human' strivings and passions." He also condemns those who "speak of Providence and the plan of Providence" in a way that is "empty" of ideas since "for them the plan of Providence is inscrutable and incomprehensible." For Hegel, history is "the necessary development, out of the concept of the

mind's freedom alone." But this development and this freedom are entirely matters of necessity as far as individuals and their works are concerned. "They are all the time the unconscious tools and organs of the world mind at work within them."

For Marx, history seems likewise to have the same necessity. He deals with individuals, he writes in the preface to *Capital*, "only in so far as they are the personifications of economic categories, embodiments of particular class-relations and class-interests. My stand-point," he says, is one from which "the evolution of the economic formation of society is viewed as a process of natural history," and within which the individual cannot be "responsible for relations whose creature he socially remains, however much he may subjectively raise himself above them." Here it is a question only "of these laws themselves, of these tendencies working with iron necessity towards inevitable results."

According to the historical determinism of Hegel and Marx, which is further considered in the chapter on HISTORY, men play a part which is already written for them in the scroll of history. Human liberty apparently depends on man's knowledge of and acquiescence in the unfolding necessities.

HISTORICAL DETERMINISM is merely a part of the doctrine of a causal necessity which governs all things. Causality seems to be understood by moderns like Spinoza, Hume, and Freud as excluding the possibility of chance or free will. Among the ancients, Plotinus alone seems to go as far as Spinoza in affirming the universal reign of natural necessity. What Spinoza says of God or Nature, Plotinus says of the All-One, namely, that for the first principle which is the cause of everything else, freedom consists in being *causa sui*, or cause of itself—self-determined rather than determined by external causes.

"God does not act from freedom of the will," Spinoza writes. Yet "God alone is a free cause, for God alone exists . . . and acts from the necessity of his own nature." As for everything else in the universe, Spinoza maintains that "there is nothing contingent, but all things are determined from the necessity of the divine

nature to exist and act in a certain manner." This applies to man, who, according to Spinoza, does "everything by the will of God alone."

From quite different premises, Hume seems to reach much the same conclusion concerning chance and liberty. "Chance," he writes, "when strictly examined, is a mere negative word, and means not any real power which has anywhere a being in nature." But he also thinks that liberty, "when opposed to necessity, not to constraint, is the same thing with chance."

Hume embraces the consequences of such a position. "If voluntary action be subjected to the same laws of necessity with the operations of matter, there is a continued chain of necessary causes, pre-ordained and pre-determined, reaching from the original cause of all to every single volition of every human creature. No contingency anywhere in the universe; no indifference; no liberty."

When confronted with the objection that it then becomes impossible "to explain distinctly, how the Deity can be the mediate cause of all the actions of men, without being the author of sin and moral turpitude," Hume replies that "these are mysteries, which natural and unassisted reason is very unfit to handle. . . . To defend absolute decrees, and yet free the Deity from being the author of sin, has been found hitherto to exceed all the power of philosophy."

Unlike Spinoza and Hume, Freud does not deal with the theological implications or presuppositions of determinism. For him, determinism is an essential postulate of science and even to some extent a scientifically discoverable fact. The "deeply rooted belief in psychic free-

dom and choice," he writes, is "quite unscientific, and it must give ground before the claims of a determinism which governs even mental life." He thinks it can be shown on the basis of clinical experience that every psychic association "will be strictly determined by important inner attitudes of mind, which are unknown to us at the moment when they operate, just as much unknown as are the disturbing tendencies which cause errors, and those tendencies which bring about so-called 'chance' actions."

The fatalism of what is often called "scientific determinism" is that of blind necessity. It not only eliminates liberty and chance, but also purpose and the operation of final causes. Every future event, in nature, history, or human behavior, is completely predetermined by efficient causes—predetermined, but not predestined, for there is no guiding intelligence at work, no purpose to be fulfilled. "The system of *fatality*, of which Spinoza is the accredited author," Kant writes, is one which "eliminates all *trace of design*, and leaves the original ground of the things of nature divested of all intelligence."

Whether such complete fatalism is the only doctrine compatible with the principles and findings of natural science has been questioned by philosophers like William James. It is certainly not the only doctrine compatible with the view that nothing happens without a cause. As the chapters on CHANCE and WILL show, ancient and mediaeval thinkers who affirm contingency in nature or freedom in human acts do so without denying the universal reign of causation.

OUTLINE OF TOPICS

	PAGE
1. The decrees of fate and the decisions of the gods	521
2. The fated or inevitable in human life	
3. The antitheses of fate: fortune, freedom, natural necessity, chance or contingency	522
4. Fatalism in relation to the will of God: the doctrine of predestination	523
5. The secularization of fate: scientific or philosophical determinism	
6. The historian's recognition of fate: the destiny of cities, nations, empires	524

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The decrees of fate and the decisions of the gods

- 4 HOMER: *Iliad*, BK I [503-531] 8b-c; BK VIII [66-77] 51d; BK XIII [631-632] 94d; BK XIV [52-53] 98c; BK XVI [431-461] 117a-b; [657-658] 119b; [843-861] 121c; BK XVIII [97-126] 131a-c; BK XIX [74-94] 137d-138a; BK XXI [81-84] 149a; BK XXII [131-223] 156c-157c / *Odyssey*, BK III [225-239] 195b-c; BK XX [75] 296d
- 5 AESCHYLUS: *Suppliant Maidens* [1032-1073] 14a,c / *Prometheus Bound* 40a-51d esp [507-521] 45a-b / *Agamemnon* [1018-1034] 63a
- 5 EURIPIDES: *Alcestis* 237a-247a,c esp [1-76] 237a-238a, [213-243] 239a-b, [962-990] 245c / *Heracles Mad* [1313-1357] 376c-d / *Iphigenia Among the Tauri* [1435-1499] 424a-d
- 6 HERODOTUS: *History*, BK I, 20a-22a
- 12 EPICETUS: *Discourses*, BK I, CH 12 118d-120b
- 12 AURELIUS: *Meditations*, BK II, SECT 3 257a-b; SECT II 258a-b; BK III, SECT II 262a-b; BK V, SECT 8 269d-270b
- 13 VIRGIL: *Aeneid*, BK I [1-33] 103a-104a; [261-262] 110a; BK II [428-433] 136a; BK III [1-12] 147a; BK IV [440] 179a; [651] 185a; BK VII [286-322] 243b-245a; BK X [100-117] 304b-305a; BK XI [108-119] 331a; BK XII [725-842] 373b-376b

- 31 DESCARTES: *Objections and Replies*, 216d-217a
- 32 MILTON: *Arcades* [54-83] 26b-27a
- 46 HEGEL: *Philosophy of History*, PART II, 271b
- 47 GOETHE: *Faust*, PART II [5305-5344] 131b-132a

2. The fated or inevitable in human life

- 4 HOMER: *Iliad* 3a-179d esp BK XV [47-77] 104c-d, BK XVI [843-861] 121c, BK XVIII [52-137] 130c-131c, BK XXII [355-366] 159a, BK XXIV [522-532] 176d-177a / *Odyssey*, BK XVIII [124-150] 285b-c; BK XXII [412] 310a
- 5 AESCHYLUS: *Suppliant Maidens* [1032-1073] 14a,c / *Seven Against Thebes* 27a-39a,c esp [631-956] 34a-37d / *Prometheus Bound* [640-886] 46d-49c / *Agamemnon* 52a-69d / *Choephoroe* 70a-80d / *Eumenides* 81a-91d
- 5 SOPHOCLES: *Oedipus the King* 99a-113a,c / *Oedipus at Colonus* 114a-130a,c esp [939-999] 123a-c / *Antigone* [944-987] 139a-c / *Ajax* [736-783] 149b-d; [925-935] 151a / *Electra* 156a-169a,c / *Philoctetes* [1316-1347] 193-d 194a
- 5 EURIPIDES: *Rhesus* [595-641] 208b-c / *Alcestis* 237a-247a,c esp [1-76] 237a-238a, [213-243] 239a-b, [962-990] 245c / *Trojan Women* [686-705] 275d-276a / *Electra* 327a-339a,c / *Bacchantes* [1327-1392] 351b-352a,c / *Heracles Mad* [1311-1358] 376c-d / *Phoenician Maidens* 378a-393d esp [1-87] 378a-379a, [867-928]

Chapter 28: FORM

INTRODUCTION

THE great philosophical issues concerning form and matter have never been resolved. But the terms in which these issues were stated, from their first formulation in antiquity to the 17th or 18th centuries, have disappeared or at least do not have general currency in contemporary discourse. Kant is perhaps the last great philosopher to include these terms in his basic vocabulary. The conceptions of matter and form, he writes, "lie at the foundation of all other reflection, so inseparably are they connected with every mode of exercising the understanding. The former denotes the determinable in general, the second its determination."

The word "form" is no longer a pivotal term in the analysis of change or motion, nor in the distinction between being and becoming, nor in the consideration of the modes of being and the conditions of knowledge. The word "matter" is now used without reference to form, where earlier in the tradition all of its principal meanings involved "form" as a correlative or an opposite. Other words, such as "participation" and "imitation," have also fallen into disuse or lost the meanings which derived from their relation to form and matter.

The problems which these words were used to state and discuss remain active in contemporary thought. There is, for instance, the problem of the universal and the particular, the problem of the immutable and the mutable, the problem of the one and the many, or of sameness and diversity. These problems appear in the writings of William James and Bergson, Dewey and Santayana, Whitehead and Russell. Sometimes there is even a verbal approximation to the traditional formulation, as in Whitehead's doctrine of "eternal objects" or in Santayana's consideration of the "realm of essence" and the "realm of matter." Whatever expressions they use, these thinkers find themselves

opposed on issues which represent part, if not the whole, of the great traditional controversy between Plato and Aristotle concerning form.

THERE IS A TENDENCY AMONG the historians of thought to use the names of Plato and Aristotle to symbolize a basic opposition in philosophical perspectives and methods, or even in what William James calls "intellectual temperaments." Later writers are called "Platonists" or "Aristotelians" and doctrines or theories are classified as Platonic or Aristotelian. It almost seems to be assumed at times that these names exhaust the typical possibilities: that minds or theories must be one or the other, or some sort of mixture or confusion of the two.

If this tendency is ever justified, it seems to be warranted with regard to the problems of form. Here, if anywhere, there may be poetic truth in Whitehead's remark that the history of western thought can be read as a series of footnotes to Plato; though perhaps the observation should be added that Aristotle, the first to comment on Plato, wrote many of the principal footnotes. In Plotinus the two strains seem to be intermingled. The issue between Plato and Aristotle concerning form dominates the great metaphysical and theological controversies of the later Middle Ages, and, with some alterations in language and thought, it appears in the writings of Hobbes, Bacon, Descartes, Spinoza, and Locke, where it is partly a continuation of, and partly a reaction against, the mediaeval versions of Platonic and Aristotelian doctrine.

The most extreme reaction is, of course, to be found in those who completely reject the term *form* or its equivalents as being without significance for the problems of motion, existence, or knowledge. Bacon retains the term, but radically changes its meaning. "None should

suppose from the great part assigned by us to forms," Bacon writes, "that we mean such forms as the meditations and thoughts of men have hitherto been accustomed to." He does not mean either "the concrete forms" or "any abstract forms of ideas," but rather "the laws and regulations of simple action. . . . The form of heat or form of light, therefore, means no more than the law of heat or the law of light." But Hobbes and Locke tend to reject the term itself—especially when it occurs in the notion of substantial form—as meaningless or misleading.

"We are told," says Hobbes, "there be in the world certain essences, separated from bodies, which they call *abstract essences*, and *substantial forms*. . . . Being once fallen into this error of *separated essences*, [men] are thereby necessarily involved in many other absurdities that follow it. For seeing they will have these forms to be real, they are obliged to assign them *some place*"; which they cannot succeed in doing, according to Hobbes, "because they hold them incorporeal, without all dimension of quantity, and all men know that place is dimension, and not to be filled but by that which is corporeal."

With regard to *substantial form*, Locke declares, "I confess I have no idea at all, but only of the sound 'form.'" Those "who have been taught . . . that it was those *forms* which made the distinction of substances into their true species and genera, were led yet further out of the way by having their minds set upon fruitless inquiries after 'substantial forms'"—a subject which Locke regards as "wholly unintelligible." The general skepticism about this notion (or the distrust of its hollowness) in the 17th and 18th centuries is reflected in a bantering remark by Tristram Shandy's father. In a discussion of infant prodigies, he refers to some boy-wonders who "left off their substantial forms at nine years old, or sooner, and went on reasoning without them."

Since form and matter are supposed to be correlative, the denial to form of meaning or reality leads to materialism, as in the case of Hobbes—the affirmation of matter alone as a principle or cause. Materialists of one sort or another are the opponents of both Plato and Aristotle, and of Platonists and Aristotelians. That part of the controversy is discussed in the

chapter on MATTER. Here we are concerned with the issues arising from different views of form and its relation to matter.

THE POPULAR meaning of "form" affords an approach to the subtleties of the subject. As ordinarily used, "form" connotes figure or shape. That connotation expresses one aspect of the technical significance of "form." A great variety of things, differing materially and in other respects, can have the *same* figure or shape. The same form can be embodied in an indefinite number of otherwise different individuals. But figures or shapes are sensible forms, forms perceptible to vision and touch. To identify form with figure or shape would put an improper limitation on the meaning of form. This is popularly recognized in the consideration of the form of a work of art—the structure of an epic poem or a symphony—which seems to be more a matter of understanding than of direct sense-perception.

Bertrand Russell's definition of the form of a proposition effectively illustrates the point involved. The form of a proposition, he says, is that which remains the same in a statement when everything else is changed. For example, these two statements have the same grammatical and logical form: (1) *John followed James*, and (2) *Paul accompanied Peter*. What might be called the matter or subject matter of the two statements is completely different, but both have the same form, as may an indefinite number of other statements.

This illustration helps us to grasp the meaning of form, and the distinction between form and matter, or the formal and the material aspects of anything. It is thus that we understand the phrase "formal logic" to signify a study of the forms of thought or discourse, separated from the subject matter being thought about or discussed. Similarly, abstractionism or surrealism is a kind of formalism in painting which tries to separate visible patterns or structures from their representative significance or their reference to familiar objects.

Kant's doctrine of space and time as transcendental forms of intuition exemplifies the meaning of form as pure order or structure divorced from sensuous content. "That which in the phenomenon corresponds to the sensation,

I term its *matter*," he writes; "that which effects that the content of the phenomenon can be arranged under certain relations, I call its *form*." Sometimes the consideration of form emphasizes not its separation from, but its union with matter. The form dwells in the thing, constituting its nature. The sensible or intelligible characteristics of a thing result from the various ways in which its matter has been formed.

It is impossible to say more about the meaning of *form* without facing at once the great controversy between Plato and Aristotle and the difficulties which their theories confront.

PLATO DOES NOT deny that things—the sensible, material, changing things of experience—have something like form. Nor does he deny that the ideas by which we understand the natures of things are like forms. Rather he asks us to consider that which they are *like*.

In the *Phaedo*—only one of the many dialogues in which the doctrine of forms is discussed—Socrates argues that "there is such a thing as equality, not of one piece of wood or stone with another, but that, over and above this, there is absolute equality." Socrates gets Simmias to admit that "we know the nature of this absolute essence," and then asks, "Whence did we obtain our knowledge?" It could not have been obtained from the pieces of wood or stone, Socrates tries to show, because they "appear at one time equal, and at another time unequal," whereas the idea of equality is never the same as that of inequality. Hence he thinks "we must have known equality previously to the time when we first saw the material equals. . . . Before we began to see or hear or perceive in any way, we must have had a knowledge of absolute equality, or we could not have referred to that standard the equals which are derived from the senses." The equality which supplies the "standard" by which material equals are measured is the Form or Idea of equality.

What is true in this one case Socrates thinks is true in every other. Whether we consider the "essence of equality, beauty, or anything else," Socrates holds, the "Ideas or essences, which in the dialectical process we define as . . . true existences . . . are each of them always

what they are, having the same simple self-existent and unchanging forms, not admitting of variation at all, or in any way or at any time." Apart from the perishable things of the sensible world, and apart from the ideas which are involved in our process of learning and thinking, there exist the Forms or the Ideas themselves—the immutable objects of our highest knowledge.

Because the same English words are employed in these quite distinct senses, it is useful to follow the convention of translators who capitalize the initial letter when "Form" or "Idea" refers to that which is separate from the characteristics of material things and from the ideas in our mind. The words "Form" and "Idea" are interchangeable, but the words "Idea" and "idea" are not. The latter refers to a notion in the human mind, by which it knows; whereas "Idea"—as Plato uses the word—signifies the object of knowledge, *i.e.* that which is known. These differences are further discussed in the chapter on IDEA.

By imitating the Forms, sensible things, according to Plato, have the characteristics we apprehend in them. The ideas we have when we apprehend the resemblance between sensible things and their Forms (which sensible things exhibit), would seem to be indirect apprehensions of the Forms themselves. When in the *Republic* Socrates discusses knowledge and opinion, he distinguishes them from one another according to a division of their objects—the realm of intelligible being on the one hand, and the realm of sensible becoming on the other. The latter stands to the former as image or copy to reality, and Socrates finds this relationship repeating itself when he further divides each of the two parts. The realm of becoming divides into images or shadows and into that "of which this is only the resemblance," namely, "the animals which we see, and everything that grows or is made." The realm of intelligible being he also subdivides into two parts, of which the first is as an image or reflection of the second, namely, the hypotheses we form in our minds and the Ideas or Forms themselves.

From this it appears that just as we should regard the form of the thing as an imitation of, or participation in, the separate Form, so should

we regard the idea we have (that is, our understanding of the thing) as an approximation of the Idea. The Ideas are outside the human mind even as the Forms are separate from their sensible, material imitations. When we apprehend things by reason we know the Forms they imitate; when we apprehend them by our senses we know them as imitations, or as images of the Ideas.

THE PLATONIC THEORY changes the ordinary meaning of the word "imitation." We ordinarily think of imitation as involving a relation of resemblance between two sensible things, both of which we are able to perceive; for example, we say that a child imitates his father's manner, or that a portrait resembles the person who posed for it. The painter, according to Socrates in the *Republic*, is not the only "creator of appearances." He compares the painter who pictures a bed with the carpenter who makes one.

Like the bed in the painting, the bed made by the carpenter is not the real bed. It is not, says Socrates, the Idea "which, according to our view, is the essence of the bed." The carpenter "cannot make true existence, but only some semblance of existence." As the bed in the picture is an imitation of the particular bed made by the carpenter, so the latter is an imitation of the Idea—the essential *bed-ness* which is the model or archetype of all particular beds.

Shifting to another example, we can say that a statue, which resembles a particular man, is the imitation of an imitation, for the primary imitation lies in the resemblance between the particular man portrayed and the Form or Idea, Man. Just as the statue derives its distinctive character from the particular man it imitates, so that particular man, or any other, derives his manhood or humanity from Man. Just as the particular man imitates Man, so our idea of Man is also an imitation of that Idea. Knowledge, according to Plato, consists in the imitation of Ideas, even as sensible, material things have whatever being they have by imitation of the true beings, the Forms.

Another name for the primary type of imitation is "participation." To participate in is to partake of. In the dialogue in which Plato has the young Socrates inquiring into the relation

between sensible particulars and the Ideas or Forms, Parmenides tells him that "there are certain ideas of which all other things partake, and from which they derive their names; that similars, for example, become similar, because they partake of similarity; and great things become great, because they partake of greatness; and that just and beautiful things become just and beautiful, because they partake of justice and beauty." The Forms or Ideas are, Parmenides suggests, "patterns fixed in nature, and other things are like them, and resemblances of them—what is meant by the participation of other things in the ideas, is really assimilation to them."

The fact of particularity and multiplicity seems to be inseparable from the fact of participation. That in which the many particulars participate must, on the other hand, have universality and unity. The Forms or Ideas are universals in the sense that each is a one which is somehow capable of being in a many—by resemblance or participation. Parmenides asks Socrates whether he thinks that "the whole idea is one, and yet, being one, is in each one of the many." When Socrates unhesitatingly says Yes, Parmenides points out to him that we then confront the difficulty that "one and the same thing will exist as a whole at the same time in many separate individuals" and that "the ideas themselves will be divisible, and things which participate in them will have a part of them only and not the whole idea existing in each of them." Nor can we say, Socrates is made to realize, that "the one idea is really divisible and yet remains one."

THIS DIFFICULTY concerning the relation of particulars to the Ideas they participate in, is discussed in the chapter on UNIVERSAL AND PARTICULAR. It is not the only difficulty which Plato himself finds in the theory of Ideas. Another concerns the individuality of each of the indefinite number of particulars which copy a single model or archetype. What makes the various copies of the same model different from one another?

Plato meets this problem by adding a third principle. To the intelligible patterns or archetypes and their sensible imitations, he adds, in the *Timaeus*, the principle which is variously

named, sometimes "the receptacle," sometimes "space," sometimes "matter." However named, it is the absolutely formless, for "that which is to receive all Forms should have no form. . . . The mother and receptacle of all visible and in any way sensible things . . . is an invisible and formless being which receives all things and in some mysterious way partakes of the intelligible, and is most incomprehensible."

It is this material or receiving principle which somehow accounts for the numerical plurality and the particularization of the many copies of the one absolute model. When a number of replicas of the same pattern are produced by impressing a die on a sheet of plastic material at different places, it is the difference in the material at the several places which accounts for the plurality and particularity of the replicas. Yet the one die is responsible for the character common to them all.

The sensible things of any one sort are not only *particular* because the Form they imitate is somehow received in matter; they are also *perishable* because of that fact. The receptacle is the principle of generation or of change. It is, Timaeus says, "the natural recipient of all impressions," which is "stirred and informed by them, and appears different from time to time by reason of them, but the forms which enter into and go out of her are the likenesses of real existences modelled after their patterns in a wonderful and inexplicable manner."

Matter, as Plato here suggests, is the mother of changing things, things which, between coming to be and passing away, are what they are because of the unchanging Forms. The Form which is received in matter for a time makes the changing thing an *imitation*, as the matter in which the Form is received makes the changing thing a *participation*.

The admittedly mysterious partaking of the Forms by the formless receptacle constitutes the realm of becoming, in which being and non-being are mixed. But the Forms or Ideas themselves, existing apart from their sensible imitations, are "uncreated and indestructible, never receiving anything from without, nor going out to any other, but invisible and imperceptible by any sense." They constitute the realm of pure being. They are the intelligible reality.

THE CRITICISM OF the Forms or Ideas which we find in the writings of Aristotle is primarily directed against their separate existence. "Plato was not far wrong," Aristotle says, "when he said that there are as many Forms as there are kinds of natural object"; but he immediately adds the qualification: "if there *are* Forms distinct from the things of this earth." It is precisely that supposition which Aristotle challenges.

Aristotle's criticism of Plato stems from his own notion of substance, and especially from his conception of sensible substances as composed of matter and form. He uses the word "substance" to signify that which exists in and of itself; or, in other words, that which exists separately from other things. Hence, when he says that, in addition to sensible substances, "Plato posited two kinds of substances—the Forms and the objects of mathematics," he is translating the affirmation that the Forms have being separately from the sensible world of changing things, into an assertion that they are substances.

"Socrates did not make the universals or the definitions exist apart," Aristotle writes; but referring to the Platonists, he says, "*they*, however, gave them separate existence, and this was the kind of thing they called Ideas." What proof is there, he repeatedly asks, for the separate existence of the Forms, or universals, or the objects of mathematics? "Of the various ways in which it is proved that the Forms exist," he declares, "none is convincing." Furthermore, he objects to the statement that "all other things come from the Forms"; for "to say that they are patterns and the other things share in them is to use empty words and poetical metaphors." There is the additional difficulty, he thinks, that "there will be several patterns of the same thing, and therefore several Forms; e.g., 'animal' and 'two-footed' and also 'man himself' will be Forms of man."

Aristotle's denial of separate existence, or substantiality, to the Ideas or universals stands side by side with his affirmation of the place of forms in the being of substances and the role of universals in the order of knowledge. Furthermore, he limits his denial of the substantiality of Ideas to those Forms which seem to be the archetypes or models of sensible things. Par-

ticular physical things—familiar sensible substances, such as the stone, the tree, or the man—are not, in his opinion, imitations of or participations in universal models which exist apart from these things. He leaves it an open question whether there are self-subsistent Forms or Ideas—that is, purely intelligible substances—which do not function as the models for sensible things to imitate.

Stated positively, the Aristotelian theory consists in two affirmations. The first is that the characteristics of things are determined by “indwelling forms,” which have their being not apart from but in the things themselves. To illustrate his meaning he turns to the realm of art. When we make a brass sphere, he writes, “we bring the form,” which is a sphere, “into this particular matter,” the brass, and “the result is a brazen sphere.” There is no “sphere apart from the individual spheres,” and no brass apart from the particular lumps of metal that are brass. “The ‘form’ means the ‘such,’ and is not a ‘this’—a definite thing,” such as *this* individual brazen sphere.

Aristotle analyzes natural things in the same manner. It is from “the indwelling form and the matter,” he says, that “the concrete substance is derived.” Men such as Callias or Socrates, for example, consist of “such and such a form in this flesh and in these bones,” and “they are different in virtue of their matter (for that is different) but the same in form.” The flesh and bones of Callias are not the flesh and bones of Socrates; but though different as *individual* men, they are the same as *men* because they have the same form.

The second point is that our understanding of things involves the forms of things, but now somehow in the intellect rather than in the things themselves. In order to know things, Aristotle says, we must have within us “either the things themselves or their forms. The former alternative is of course impossible: it is not the stone which is present in the soul,” he maintains, “but its form.”

The form in the thing is as individual as the thing itself. But in the mind, as the result of the intellect’s power to abstract this form from its matter, the form becomes a universal; it is then called by Aristotle an “idea,” “abstraction,” or “concept.” Forms are universals in the mind

alone. If there were a form existing apart from both matter and mind, it would be neither an individual form nor an abstract universal.

The indwelling forms, according to Aristotle, are not universals. Except for the possibility of Forms which dwell apart and bear *no resemblance at all* to sensible things, all forms are either in matter or, abstracted from matter, in the human mind. These are often called “material forms” because they are the forms which matter takes or can take, and which the mind abstracts from matter. Their being consists in informing or determining matter, just as the being of matter consists in the capacity to receive these forms and to be determined by them.

THE FOREGOING helps to explain Aristotle’s use of the word “composite” as a synonym for “substance” when he is considering particular sensible things. The independently existing, individual physical things which Aristotle calls “substances” are all composite of form and matter. He sometimes also calls form and matter “substances,” but when he uses the word “substance” strictly and in its primary sense, he applies it only to the concrete individual. Form and matter are only principles or constituents of the concrete thing—the composite substance.

The union of form and matter to constitute physical substances also explains the Aristotelian identification of form with actuality and of matter with potentiality; and the relation of form and matter to a third term in the analysis of change, namely, *privation*. As a physical thing changes, its matter gives up one form to take on another. Its matter thus represents its capacity or *potentiality* for form. Matter is the *formable* aspect of changing things. What things are *actually* at any moment is due to the forms they possess. But they may have the potentiality for acquiring other forms, with respect to which they are in *privation*.

“The mutability of mutable things,” Augustine writes, “is simply their capacity for all the forms into which mutable things can be changed.” Change consists in a *transformation* of *matter*, which is another way of saying that it consists in the *actualization* of a thing’s *potentialities*. The Aristotelian theory of form and matter is a theory of becoming as well as an

analysis of the being of changing things. Illustrative applications of this theory will be found in the chapters on ART, CAUSE, and CHANGE.

Some forms are sensible. Some are shapes, some are qualities, some are quantities. But not all forms are perceptible by the senses; as, for example, the form which matter takes when a plant or animal is generated and which gives the generated thing its specific nature. This type of form came to be called a "substantial form" because it determines the kind of substance which the thing is. In contrast, the forms which determine the properties or attributes of a thing are called its "accidents" or "accidental forms." For example, size and shape, color and weight, are accidental forms of a man; whereas that by virtue of which this thing (*having* a certain size, shape, and color) is a *man*, is its substantial form.

Aristotle's distinction between substantial and accidental form affects his analysis of change and his conception of matter. Generation and corruption are for him substantial change, change in which matter undergoes transformation with respect to its substantial form. The various types of motion—alteration, increase or decrease, and local motion—are changes which take place in enduring substances, and with respect to their accidental forms.

The substratum of accidental change is not formless matter, but matter having a certain substantial form; whereas in the coming to be or passing away of substances, the substratum would seem to be a primary sort of matter, devoid of all form. As indicated in the chapter on MATTER, this, according to Aristotle, is "the primary substratum of each thing, from which it comes to be without qualification, and which persists in the result." He tries to help us grasp prime matter by using an analogy. "As the bronze is to the statue, the wood to the bed," he writes, "so is the underlying nature to substance"—matter absolutely formless to substantial form.

Aristotle sometimes speaks of the substantial form as a first act or actuality, and of accidental forms as second actualities. Accordingly he also distinguishes between a primary and secondary kind of matter—the one absolutely potential, and underlying substantial change; the other

partly actualized and partly potential, and involved in accidental change. "Primary matter," Aquinas explains, "has substantial being through its form. . . . But when once it exists under one form it is in potentiality to others."

Perhaps one more distinction should be mentioned because of its significance for later discussions of form. Regarding living and non-living things as essentially distinct, Aristotle differentiates between the forms constituting these two kinds of substances. As appears in the chapter on SOUL, he uses the word "soul" to name the substantial form of plants, animals, and men.

BOTH THE PLATONIC theory of the separate Forms and the Aristotelian theory of the composition of form and matter raise difficulties which their authors consider and which become the subject of intense controversy among Platonists and Aristotelians in the Hellenistic and mediaeval periods.

The Platonic theory faces a question which arises from supposing the existence of an eternal and immutable Form for every appearance in the sensible world of becoming. If the Idea and the individual are alike, then "some further idea of likeness will always be coming to light," Parmenides says to Socrates; "and if that be like anything else, then another; and new ideas will be always arising, if the idea resembles that which partakes of it." Because of this difficulty with the doctrine of participation, Parmenides suggests that it may be necessary to conclude that "the Idea cannot be like the individual or the individual like the Idea." In addition, the relationships of the Forms to one another presents a difficulty. Is the relation of one Form to another, Parmenides asks, determined by the essence of each Form, or by the relationships among the sensible particulars that imitate the Forms in question? Either solution seems to be unsatisfactory because of the further difficulties which both raise.

Yet, after propounding questions of this sort, and multiplying difficulties, Parmenides concludes by telling Socrates why the theory of Ideas cannot be given up. "If a man, fixing his attention on these and like difficulties," he says, "does away with the Forms of things and will not admit that every individual thing has

its own determinate Idea which is always one and the same, he will have nothing on which his mind can rest; and so he will utterly destroy the power of reasoning."

The Aristotelian theory has difficulties of its own with respect to the ultimate character of matter apart from all forms. Completely formless matter would be pure potentiality and would therefore have no actual being. It would be completely unintelligible, since form is the principle of anything's intelligibility. Nevertheless, something like formless matter seems to be involved in substantial change, in contrast to the substantially formed matter which is the substratum of accidental change.

The problem of prime matter is related in later speculations to the problem of the number and order of the various forms which matter can take. The question is whether matter must have a substantial form before it can have any accidental form; and whether it can have a second substantial form in addition to a first, or is limited to having a single substantial form, all subsequent forms necessarily being accidental.

Aquinas plainly argues in favor of the unity of substantial form. "Nothing is absolutely one," he maintains, "except by one form, by which a thing has being; because a thing has both being and unity from the same source, and therefore things which are denominated by various forms are not absolutely one; as, for instance, a white man. If, therefore," Aquinas continues, "man were *living* by one form, the vegetative soul, and *animal* by another form, the sensitive soul, and *man* by another form, the intellectual soul, it would follow that man is not absolutely one. . . . We must, therefore, conclude," he says, "that the intellectual soul, the sensitive soul, and the nutritive soul are in man numerically one and the same soul." In other words, "of one thing there is but one substantial form." It is not only "impossible that there be in man another substantial form besides the intellectual soul," but there is also no need of any other, because "the intellectual soul contains virtually whatever belongs to the sensitive soul of brute animals and the nutritive soul of plants."

The Aristotelian theory also has difficulties with respect to substantial forms as objects of

knowledge and definition. The definition which the mind formulates attempts to state the essence of the thing defined. The formulable essence of a thing would seem to be identical with its form. But Aristotle raises the question and his followers debate at length whether the essence of a composite substance is identical with its substantial form or includes its matter as well.

Among his followers Aquinas maintains that, in defining the essence or species of a composite substance, the genus is used to signify the matter and the differentia the form. "Some held," he writes, "that the form alone belongs to the species, while the matter is part of the individual, and not of the species. This cannot be true, for to the nature of the species belongs what the definition signifies, and in natural things the definition does not signify the form only, but the form and the matter. Hence in natural things the matter is part of the species; not, indeed, *signate* matter, which is the principle of individuation, but *common* matter." He explains in another place that "matter is twofold; common and *signate*, or individual: common, such as flesh and bone; individual, such as this flesh and these bones." In forming the universal concept *man*, for example, the intellect abstracts the notion of the species "from *this flesh and these bones*, which do not belong to the species as such, but to the individual. . . . But the species of *man* cannot be abstracted by the intellect from *flesh and bones*."

As will be seen in the chapters on ONE AND MANY and UNIVERSAL AND PARTICULAR, the Platonic and the Aristotelian theories of form are equally involved in the great problem of the universal and the individual. Even though they seem to be diametrically opposed on the existence of universals—whether apart from or only in minds—both Plato and Aristotle face the necessity of explaining individuality. What makes the particular that imitates a universal Form the unique individual it is? What makes the indwelling form of a composite substance an individual form, as unique as the individual substance of which it is the form?

We have already noted that both Platonists and Aristotelians appeal to matter as somehow responsible for individuation or individuality, but that only raises further questions. The

Platonists conceive matter as the receptacle of all Forms, and so in itself absolutely formless. How, then, can it cause the particularizations which must be accounted for? Since prime matter, like the receptacle, is formless, the Aristotelians resort to what they call "signate matter" or "individual matter" to explain the individuality of forms and substances; but it has been argued that this only begs the question rather than solves it.

THE CORRELATIVE terms *form* and *matter* seem to occur in modern thought under the guise of certain equivalents; as, for example, the distinct substances which Descartes calls "thought" and "extension"—*res cogitans* and *res extensa*—or the infinite attributes of substance which Spinoza calls "mind" and "body." They appear more explicitly in Kant's analysis of knowledge, related as the *a priori* and the *a posteriori* elements of experience. But it is in the great theological speculations of the Middle Ages that the most explicit and extended use of these terms is made, often with new interpretations placed on ancient theories.

The doctrine of spiritual substances, for example, has a bearing on the theory of self-subsistent Forms. The angels are sometimes called "separate forms" by the theologians. They are conceived as immaterial substances, and hence as simple rather than composite. But though Plotinus identifies the order of purely intelligible beings with the pure intelligences, the Christian theologian does not identify the Platonic Ideas with the angels. He regards the angels as intelligences. They exist as pure forms, and therefore are intelligible as well as intellectual substances. But they are in no sense the archetypes or models which sensible things resemble.

Nevertheless, Christian theology does include that aspect of the Platonic theory which looks upon the Ideas as the eternal models or patterns. But, as Aquinas points out, the separately existing Forms are replaced by what Augustine calls "the exemplars existing in the divine mind."

Aquinas remarks on the fact that "whenever Augustine, who was imbued with the doctrines of the Platonists, found in their teaching anything consistent with faith, he adopted it; and

those things which he found contrary to faith he amended." He then goes on to say that Augustine could not adopt, but had to amend, the teaching of the Platonists that "the forms of things subsist of themselves apart from matter." He did this, not by denying the ideas, "according to which all things are formed," but by denying that they could exist outside the divine mind. The divine ideas are the eternal exemplars and the eternal types—*types*, Aquinas explains, insofar as they are the likenesses of things and so the principles of God's knowledge; *exemplars* insofar as they are "the principles of the making of things" in God's act of creation.

The profound mystery of the creative act which projects the divine ideas into substantial or material being replaces the older problem of how physical things derive their natures by participation in the Forms. According to the Aristotelian theory, both natural generation and artistic production involve the transformation of a pre-existent matter. According to the Platonic myth of the world's origin, only changing things are created, neither the receptacle nor the Ideas. But the Christian dogma of creation excludes everything from eternity except God.

Ideas are eternal only as inseparable from the divine mind. Being spiritual *creatures*, the angels, or self-subsistent forms, are not eternal. And in the world of corporeal creatures, matter as well as its forms must begin to be with the creation of things. Since matter and its forms cannot exist in separation from one another, the theologians hold that God cannot create them separately. God cannot be supposed, Augustine says, "first to have made formless matter, and after an interval of time, formed what He had first made formless; but," he goes on, "as intelligible sounds are made by a speaker, wherein the sound issues not formless at first and afterwards receives a form, but is uttered already formed; so must God be understood to have made the world of formless matter, but contemporaneously to have created the world." God "concreates" form and matter, Augustine holds, "giving form to matter's formlessness without any interval of time."

Defending Augustine's interpretation of the passage in Genesis which says that the earth,

which God in the beginning created, "was unformed and void," Aquinas argues that "if formless matter preceded in duration, it already existed; for this is implied by duration. . . . To say, then, that matter preceded, but without form, is to say that being existed actually, yet without actuality, which is a contradiction in terms. . . . Hence we must assert that primary matter was not created altogether formless." But neither, according to Aquinas, can the form of any material thing be created apart from its matter. "Forms and other non-subsisting things, which are said to co-exist rather than to exist," he declares, "ought to be called *concreated* rather than *created* things."

Aristotle's theory of physical substances as composite of form and matter raises certain special difficulties for Christian theology. Those

who, like Aquinas, adopt his theory must also adapt it to supernatural conditions when they deal with the problems of substance involved in the mystery of the Incarnation of the second person of the Trinity and the mystery of transubstantiation in the Eucharist.

Furthermore, Aristotle's identification of soul with the substantial form of a living thing makes it difficult to conceive the separate existence of the individual human soul. Again an adaptation is required. As indicated in the chapters on IMMORTALITY and SOUL, the Christian doctrine of personal survival is given an Aristotelian rendering by regarding the human soul as a form which is not completely material. Hence it is conceived as capable of self-subsistence when, with death and the dissolution of the composite nature, it is separated from the body.

OUTLINE OF TOPICS

	PAGE
1. Form in relation to becoming or change	536
1a. Forms as immutable models or archetypes: the exemplar ideas	
1b. Forms as indwelling causes or principles	
1c. The transcendental or <i>a priori</i> forms as constitutive of order in experience	537
1d. The realization of forms in the sensible order	
(1) Imitation or participation: the role of the receptacle	
(2) Creation, generation, production: embodiment in matter or substratum	
2. The being of forms	538
2a. The existence of forms: separately, in matter, in mind	
2b. The eternity of forms, the perpetuity of species: the divine ideas	
2c. Form in the composite being of the individual thing	539
(1) The union of matter and form: potentiality and actuality	
(2) The distinction between substantial and accidental forms	
(3) The unity of substantial form: prime matter in relation to substantial form	
2d. Angels and human souls as self-subsistent forms: the substantiality of thought or mind in separation from extension or body	540
3. Form in relation to knowledge	
3a. Sensible forms, intelligible forms: the forms of intuition and understanding	
3b. The problem of the universal: knowledge of the individual	541
3c. Form and definition: the formulable essence; the problem of matter in relation to definition	
4. The denial of form as a principle of being, becoming, or knowledge	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 29: GOD

INTRODUCTION

WITH the exception of certain mathematicians and physicists, all the authors of the great books are represented in this chapter. In sheer quantity of references, as well as in variety, it is the largest chapter. The reason is obvious. More consequences for thought and action follow from the affirmation or denial of God than from answering any other basic question. They follow for those who regard the question as answerable only by faith or only by reason, and even for those who insist upon suspending judgment entirely.

In addition to the primary question of God's existence, there are all the problems of the divine nature and of the relation of the world and man to the gods or God. The solutions of these problems cannot help influencing man's conception of the world in which he lives, the position that he occupies in it, and the life to which he is called.

The whole tenor of human life is certainly affected by whether men regard themselves as the supreme beings in the universe or acknowledge a superior—a superhuman being whom they conceive as an object of fear or love, a force to be defied or a Lord to be obeyed. Among those who acknowledge a divinity, it matters greatly whether the divine is represented merely by the concept of God—the object of philosophical speculation—or by the living God whom men worship in all the acts of piety which comprise the rituals of religion.

The most radical differences in man's conception of his own nature follow from the exclusion of divinity as its source or model on the one hand, and from the various ways in which man is seen as participating in divinity on the other. Many fundamental themes and issues are therefore common to this chapter and to the chapter on MAN.

SOME OF THE TOPICS in this chapter are primarily philosophical. They belong to the subject matter of rational speculation or poetic imagination in all the great epochs of our culture, regardless of differences in religious belief. Other topics, however, are peculiarly restricted to matters of faith or religion. With respect to such matters, dogmatic differences, or differences in articles of faith, must be explicitly recognized.

The materials here assembled must therefore, in some instances, be divided according to their origin from pagan or from Jewish and Christian sources. Though no great books from the Mohammedan tradition are included in this set, the fact that Gibbon discusses the Moslem faith and compares its teachings with those of Judaism and Christianity explains the inclusion of Mohammedanism in one group of topics. That is the group which deals with the doctrines common to these three religions, as distinguished from the tenets on which Judaism and Christianity differ dogmatically. The existence of certain common beliefs in the western tradition enables us to begin, as it seems advisable to do, with the conception of God that is shared by the living religions of western culture today.

In our civilization, what is denied by an atheist who says there is no God? Not idols or images which men may seek to placate. Not philosophical constructions or mythological figures. Certainly not the universe itself, either as an infinite and everlasting whole, or as finite and temporal, but equally mysterious in its ultimate incomprehensibility to the human mind. In our civilization, the atheist denies the existence of a supernatural being, the object of religious belief and worship among Jews, Christians, and Mohammedans. He denies the single, personal God Who created the world out of

nothing, Who transcends this created universe and sustains it by His immanent power, Who has made laws for the government of all things and cares for each particular by His providence, and Who created man in His own image, revealed Himself and His will to men, and metes out eternal rewards and punishments to the children of Adam, whom He also helps by His grace.

In this religious conception of God, one term must be saved from misinterpretation. The word "personal" should not be read with anthropomorphic imagery, though its meaning does entitle man as well as God to be called a person rather than a thing. "Although the term *person* is not found applied to God in Scripture, either in the Old or New Testament," Aquinas writes, "nevertheless what the term signifies is found to be affirmed of God in many places of Scripture; as that He is the supreme self-subsisting being, and the most perfectly intelligent being."

Boethius had defined a person as "an individual substance of a rational nature," or, as Locke later said, "a thinking intelligent being." In applying the term *person* to God, in the meaning which Boethius had given it, Aquinas comments on the difference in its meaning when it is applied to men. God can be said to have a *rational nature*, he writes, only "if reason be taken to mean, not discursive thought, but, in a general sense, an intelligent nature . . . God cannot be called an *individual*" in the sense in which physical things are, but only in the sense of uniqueness. "*Substance* can be applied to God [only] in the sense of signifying self-subsistence." Aquinas does not conclude from this that "person" is said improperly of God, but rather that when God is called "personal" the meaning is applied "in a more excellent way," for God does not *possess*, God *is*, an intelligence.

We shall use this idea of a personal God, the reality of which the contemporary atheist denies, in order to distinguish divergent conceptions in other doctrines. Then we shall examine more closely what is involved in this idea itself.

IN THE WESTERN tradition, the various pagan religions—reflected especially in the poems and

histories of Greek and Roman antiquity—were all polytheistic. The number of their gods, Montaigne estimates, "amounts to six-and-thirty thousand." Augustine offers one explanation of why there were so many. "The ancients," he writes, "being deceived either by their own conjectures or by demons, supposed that many gods must be invited to take an interest in human affairs, and assigned to each a separate function and a separate department—to one the body, to another the soul; and in the body itself, to one the head, to another the neck, and each of the other members to one of the gods; and in like manner, in the soul, to one god the natural capacity was assigned, to another education, to another anger, to another lust; and so the various affairs of life were assigned—cattle to one, corn to another, wine to another, oil to another, the woods to another, money to another, navigation to another, wars and victories to another, marriages to another, births and fecundity to another, and other things to other gods."

That polytheism, no less than monotheism, conceives the divine as personal, appears in Plato's *Apology*. When Socrates is accused of atheism, he asks whether the indictment means that he does not "acknowledge the gods which the state acknowledges, but some other new divinities or spiritual agencies in their stead." Meletus answers that he thinks Socrates is a complete atheist who recognizes no gods at all. To this Socrates replies by suggesting that his enemies must be confusing him with Anaxagoras, who had blasphemed against Apollo by calling the sun "a red hot stone." As for himself, he offers evidence to show that he believes in divine or spiritual agencies "new or old, no matter"; and "if I believe in divine beings," he asks, "how can I help believing in spirits or demigods?"

Like the one God of Judaism and Christianity, the many gods of pagan antiquity have immortal life, but they are not without origin. Zeus is the son of Kronos, and he has many offspring, both gods and demigods, who perform different functions and are not of equal station in the Olympian hierarchy. The realm of the divine includes such figures as the Titans and the Cyclops, who are neither gods nor men; and demigods, like Heracles, who are offspring

of divine and human mating. These deities exercise superhuman powers, but none is completely omnipotent or omniscient, not even Kronos or Zeus who cannot escape the decrees of Fate. Moreover, with the exception, perhaps, of that of Zeus, the power of one divinity is often challenged and thwarted by another. This aspect of polytheism and its bearing on the intervention of the gods in the affairs of men are discussed in the chapter on FATE.

The extent to which we think of the pagans as idolatrous because they made graven images of their gods in human form, or regard the pagan conceptions of the gods as anthropomorphic, depends on our interpretation of religious symbolism. Plato for one thinks that many of the poets' descriptions of the gods and their activities should be dismissed as unworthy, precisely because they debase the gods to the human level.

According to Gibbon, a Greek or Roman philosopher "who considered the system of polytheism as a composition of human fraud and error, could disguise a smile of contempt under the mask of devotion, without apprehending that either the mockery or the compliance would expose him to the resentment of any invisible, or, as he conceived them, imaginary powers." But the early Christians, he points out, saw the many gods of antiquity "in a much more odious and formidable light" and held them to be "the authors, the patrons, and the objects of idolatry."

Those who take symbols with flat literalism might also attack Christianity as anthropomorphic and idolatrous; in fact they have. The defense of Christianity against this charge does not avail in the case of Roman emperor-worship, which consisted not in the humanization of the divine for the sake of symbolic representation, but in the deification of the merely human for political purposes.

Although there are radical differences, there are also certain fundamental agreements between paganism and Judaeo-Christianity regarding the nature of the divine. As we have already noted, the deities are conceived personally, not in terms of impersonal, brute forces. Conceived as beings with intelligence and will, the gods concern themselves with earthly society; they aid or oppose man's plans

and efforts; they reward men for fidelity and virtue or punish them for impiety and sin.

Despite all other differences between paganism and Christianity, these agreements are substantial enough to provide many common threads of theological speculation throughout our tradition, especially with regard to the abiding practical problems of how man shall view himself and his destiny in relation to the divine or the supernatural. We have therefore attempted to place passages from the great books of pagan antiquity under every heading except those which are specifically restricted to the dogmas of Judaism and Christianity—even under headings which are worded monotheistically, since even here there is continuity of thought and expression from Homer and Virgil to Dante and Milton; from Plato, Aristotle, and Plotinus to Augustine, Aquinas, Descartes, and Kant; from Lucretius to Newton and Darwin.

THE DOCTRINES known as deism and pantheism, like unqualified atheism, are as much opposed to the religious beliefs of polytheism as to the faith of Judaism and Christianity.

Of these two, pantheism is much nearer atheism, for it denies the existence of a transcendent supernatural being or beings. God is Nature. God is immanent in the world and, in the extreme form of pantheism, not transcendent in any way. Certain historic doctrines which are often regarded as forms or kinds of pantheism seem to be less extreme than this, for they do not conceive the physical universe as exhausting the infinite being of God. The world, for all its vastness and variety, may only represent an aspect of the divine nature.

According to Spinoza, the attributes of extension and thought, in terms of which we understand the world or nature as being of the divine substance, are merely those aspects of God which are known to us, for the divine substance consists "of infinite attributes, each one of which expresses eternal and infinite essence." In the conception of Plotinus, the whole world represents only a partial emanation from the divine source. Yet thinkers like Plotinus and Spinoza so conceive the relation of the world to God that—as in the strictest pantheism—the religious doctrines of creation, providence, and

salvation are either rejected or profoundly altered.

In the ancient world, the teaching of the Stoic philosophers expresses a kind of pantheism. "There is one universe made up of all things," Marcus Aurelius writes, "and one God who pervades all things, and one substance, and one law, one common reason in all intelligent animals, and one truth." He speaks of the "common nature," which is apparently divine, and of which "every particular nature is a part, as the nature of the leaf is a part of the nature of the plant." But, although he stresses the oneness and divinity of all things, Aurelius also at times uses language which seems to refer to a god who dwells apart from as well as in the world, as, for example, when he debates whether the gods have any concern with human affairs.

Another type of ancient pantheism appears in the thought of Plotinus, for whom all things have being only insofar as they participate in, even as they emanate from, the power of The One, or Primal Source. "God is sovrainly present through all," he writes. "We cannot think of something of God here and something else there, nor of all of God gathered at some one spot: there is an instantaneous presence everywhere, nothing containing and nothing left void, everything therefore fully held by the divine." The relation between The One and every other thing is compared to the number series. "Just as there is, primarily or secondarily, some form or idea from the monad in each of the successive numbers—the latter still participating, though unequally, in the unit—so the series of beings following upon The First bear, each, some form or idea derived from that source. In Number the participation establishes Quantity; in the realm of Being, the trace of The One establishes reality: existence is a trace of The One."

But although The One is in all things, and all things depend upon it for their very existence, The One itself has no need of them. It is in this sense that Plotinus says that "The One is all things and no one of them . . . Holding all—though itself nowhere held—it is omnipresent, for where its presence failed something would elude its hold. At the same time, in the sense that it is nowhere held, it is not present: thus

it is both present and not present; not present as not being circumscribed by anything; yet as being utterly unattached, not inhibited from presence at any point." Thus all things partake of The One in absolute dependence. But The One, *considered in itself*, is absolutely transcendent. Plotinus even denies it the name of God or Good or Being, saying it is beyond these.

Whether or not Spinoza is a pantheist, has long been debated by his commentators. An explicit, even an extreme form of pantheism would seem to be expressed in the proposition that "whatever is, is in God, and nothing can be or be conceived without God." But while the one and only substance which exists is at once nature and God, Spinoza identifies God only with the nature he calls "*natura naturans*." God is not reduced to the nature that falls within man's limited experience or understanding—the nature he calls "*natura naturata*."

"By *natura naturans*," he explains, "we are to understand that which is in itself and is conceived through itself, or those attributes of substance which express eternal and infinite essence, that is to say, God in so far as He is considered as a free cause. But by *natura naturata* I understand everything which follows from the necessity of the nature of God, or of any one of God's attributes, that is to say, all the modes of God's attributes in so far as they are considered as things which are in God and which without God can neither be nor can be conceived."

God is the infinite and eternal substance of all finite existences, an absolute and unchanging *one* underlying the finite modes in which it variably manifests itself. Though God for Spinoza is transcendent in the sense of vastly exceeding the world known to man, in no sense does God exist apart from the whole of nature. Spinoza's view thus sharply departs from that of an orthodox Jewish or Christian theologian. When the latter says that God is transcendent, he means that God exists apart, infinitely removed from the whole created universe. When the latter speaks of God as being immanent in that universe, he carefully specifies that it is not by His substance, but by the power of His action and knowledge. But Spinoza calls God "the immanent, and not the transitive, cause of

all things," for the reason that "outside God there can be no substance, that is to say, outside Him nothing can exist which is in itself."

These divergent conceptions of God's immanence and transcendence—so relevant to the question of who is or is not a pantheist—are further discussed in the chapters on NATURE and WORLD.

UNLIKE PANTHEISM, deism affirms gods or a God, personal intelligences existing apart from this world; but, as in the teaching of Lucretius, deism sometimes goes to the extreme of believing in absentee gods who neither intervene in the order of nature nor concern themselves with human affairs.

"The nature of the gods," Lucretius writes, "must ever in itself of necessity enjoy immortality together with supreme repose, far removed and withdrawn from our concerns; since exempt from every pain, exempt from all dangers, strong in its own resources, not wanting aught of us, it is neither gained by favors nor moved by anger."

Such gods neither create the world nor govern it; above all they do not reward or punish man, and so they do not have to be feared or propitiated. "To say that for the sake of men they have willed to set in order the glorious nature of the world and therefore it is meet to praise the work of the gods immortal, and that it is an unholy thing ever to shake by any force from its fixed seats that which by the forethought of the gods in ancient days has been established on everlasting foundations for mankind, or to assail it by speech and utterly overturn it from top to bottom; and to invent and add other figments of the kind . . . is all sheer folly. For what advantage can our gratitude bestow on immortal and blessed beings that for our sakes they should take in hand to administer aught?"

Divinity seems to have moral significance to Lucretius only insofar as the gods exemplify the happy life; and religion is immoral because its superstitions concerning divine motives and meddling make men servile and miserable.

When the deism of Lucretius is contrasted with the more familiar modern forms of that doctrine, the influence of Christianity is seen. The modern deist affirms the supremacy of one

God, the infinite and eternal Creator of this world, Whose laws are the laws of nature which are laid down from the beginning and which govern all created things. Rousseau speaks of this as "the religion of man" and even identifies it with Christianity—"not the Christianity of today, but that of the Gospel, which is entirely different." He describes this religion as that "which has neither temples, nor altars, nor rites, and is confined to the purely internal cult of the supreme God and the eternal obligations of morality."

Not all deists, certainly not those of the 17th and early 18th centuries, go to the Lucretian extreme of picturing an uninterested and morally neutral God. Many of them believe in an after-life. But modern deism did tend toward this extreme. By Kant's time it had even ceased to look upon God as a personal intelligence. Kant therefore takes great pains to distinguish deism from theism.

The deist, according to Kant, "admits that we can cognize by pure reason alone the existence of a supreme being, but at the same time maintains that our conception of this being is purely transcendental, and that all we can say of it is, that it possesses all reality, without being able to define it more closely." The theist, on the other hand, "asserts that reason is capable of presenting us, from the analogy with nature, with a more definite conception of this being, and that its operations, as the cause of all things, are the results of intelligence and free will."

Kant even maintains that "we might, in strict rigor, deny to the deist any belief in God at all, and regard him merely as a maintainer of the existence of a primal being or thing—the supreme cause of all other things." In any case, deism seems to be an essentially un-Jewish and un-Christian or anti-Jewish and anti-Christian doctrine, for it denies God's supernatural revelation of Himself; it denies miracles and every other manifestation of supernatural agency in the course of nature or the life of man; it denies the efficacy of prayer and sacrament. In short, it rejects the institutions and practices, as well as the faith and hope, of any religion which claims supernatural foundation and supernatural warrant for its dogmas and rituals. Deism, which "consists simply in the worship

of a God considered as great, powerful, and eternal," is, in Pascal's opinion, "almost as far removed from the Christian religion as atheism, which is its exact opposite."

What Pascal and Kant call "deism" and Rousseau "the religion of man," others like Hume call "natural religion." His *Dialogues Concerning Natural Religion* provide a classic statement of rationalism, which is the same as naturalism, in religion; though, as the chapter on RELIGION indicates, it may be questioned whether the word "religion" can be meaningfully used for a doctrine which claims no knowledge beyond that of the philosopher, and no guidance for human life beyond the precepts of the moralist.

THE SYSTEMATIC exposition of man's knowledge of God is the science of theology. In addition to considering all things—the whole world and human life—in relation to God, theology treats especially of God's existence, essence, and attributes. Throughout the range of its subject matter and problems, theology may be of two sorts: it may be either natural knowledge, obtained by ordinary processes of observation and reasoning; or knowledge which is supernatural in the sense of being based on divine revelation. This is the traditional distinction between natural and sacred or, as it is sometimes called, dogmatic theology. The one belongs to the domain of reason; it is the work of the philosopher. The other belongs to the domain of faith, and is the work of the theologian who seeks to understand his faith.

These distinctions are discussed in the chapters on THEOLOGY, METAPHYSICS, and WISDOM. Here we are concerned with different attitudes toward the problem of man's knowledge of God. The deist, as we have seen, rejects supernatural revelation and faith; theology, like religion, is held to be entirely natural, a work of reason. The agnostic makes the opposite denial. He denies that anything supernatural can be known by reason. It cannot be proved or, for that matter, disproved. The evidences of nature and the light of reason do not permit valid inferences or arguments concerning God or creation, providence or immortality.

It is usually with respect to God's existence that the agnostic most emphatically declares

reason's incompetence to demonstrate. He often accompanies the declaration with elaborate criticisms of the arguments which may be offered by others. This is not always the case, however. For example, the great Jewish theologian, Moses Maimonides, thinks that God's existence can be proved by reason entirely apart from faith; but with regard to the essence or attributes of God, his position seems to be one which might be called agnostic.

When men "ascribe essential attributes to God," Maimonides declares, "these so-called essential attributes should not have any similarity to the attributes of other things, just as there is no similarity between the essence of God and that of other beings." Since the meaning of such positive attributes as *good* or *wise* is derived from our knowledge of things, they do not provide us with any knowledge of God's essence, for no comparison obtains between things and God. Hence Maimonides asserts that "the negative attributes of God are the true attributes." They tell us not what God is, but what God is not.

Even though Maimonides holds that "existence and essence are perfectly identical" in God, he also insists that "we comprehend only the fact that He exists, not His essence. . . . All we understand," he goes on to say, in addition to "the fact that He exists," is the fact that "He is a Being to whom none of his creatures is similar." This fact is confirmed in all the negative attributes such as eternal (meaning non-temporal), infinite, or incorporeal; even as it is falsified by all the positive attributes, expressed by such names as "good" or "living" or "knowing," insofar as they imply a comparison between God and creatures. When they cannot be interpreted negatively, they can be tolerated as metaphors, but they must not be taken as expressing an understanding "of the true essence of God," concerning which Maimonides maintains, "there is no possibility of obtaining a knowledge."

Aquinas takes issue with such agnosticism about the divine nature in his discussion of the names of God. Although he says that "we cannot know what God is, but rather what He is not," Aquinas disagrees with Maimonides that all names which express some knowledge of God's essence must be interpreted negatively

or treated as metaphors. He denies that "when we say God lives, we mean merely that God is not like an inanimate thing" as "was taught by Rabbi Moses." On the contrary, he holds that "these names signify the divine substance . . . although they fall short of representing Him. . . . For these names express God, so far as our intellects know Him. Now since our intellect knows God from creatures, it knows Him as far as creatures represent Him." Therefore, Aquinas concludes, "when we say, *God is good*, the meaning is not, *God is the cause of goodness*, or, *God is not evil*: but the meaning is, *Whatever good we attribute to creatures pre-exists in God*, and in a higher way."

IF MAIMONIDES were right that the names which are said positively of both God and creatures are "applied . . . in a purely equivocal sense" (e.g., having literal meaning when said of creatures but being only metaphorical when said of God), then, according to Aquinas, it would follow that "from creatures nothing at all could be known or demonstrated about God." Those who say, on the other hand, that "the things attributed to God and creatures are univocal" (i.e., are said in exactly the same sense), claim to comprehend more than man can know of the divine essence. When the term *wise* "is applied to God," Aquinas writes, "it leaves the thing signified as uncomprehended and as exceeding the signification of the name. Hence it is evident that this term *wise* is not applied in the same way to God and to man. The same applies to other terms. Hence no name is predicated univocally of God and creatures" but rather all positive names "are said of God and creatures in an analogous sense."

A further discussion of the names of God will be found in the chapter on SIGN AND SYMBOL; and the consideration of the analogical, the univocal, and the equivocal will also be found there as well as in the chapter on SAME AND OTHER. We have dealt with these matters here only for the sake of describing that degree of agnosticism, according to which Maimonides, by contrast with Aquinas, is an agnostic. But agnosticism usually goes further and denies that man can have any natural knowledge of God—either of His existence or of His essence.

So understood, agnosticism need not be incompatible with religion, unless a given religion holds, as an article of faith itself, that the existence of God can be *proved by reason*. In fact, the agnostic may be a religious man who accepts divine revelation and regards faith as divinely inspired.

Montaigne's *Apology for Raimond de Sebonde* illustrates this position. Sebonde had written a treatise on natural theology, which to Montaigne seems "hardy and bold; for he undertakes, by human and natural reasons to establish and make good against the atheists all the articles of the Christian religion." Though Montaigne says of his work, "I do not think it possible to do better upon that subject," and though he entertains the conjecture that it may have been "drawn from St. Thomas Aquinas; for, in truth, that mind full of infinite learning and admirable subtlety, was alone capable of such imaginations"; nevertheless, Montaigne does "not believe that means purely human are, in any sort, capable of doing it."

According to Montaigne, "it is faith alone that vividly and certainly comprehends the deep mysteries of our religion." In his view, reason by itself is incapable of proving *anything*, much less *anything about God*. "Our human reasons," he writes, "are but sterile and undigested matter; the grace of God is its form; it is that which gives it fashion and value." The light and value in Sebonde's arguments come from the fact that faith supervenes "to tint and illustrate" them, and "renders them firm and solid."

Such arguments, Montaigne says, may serve as "direction and first guide to a learner" and may even "render him capable of the grace of God"; but for himself, skeptical of all arguments, the way of faith alone can provide "a certain constancy of opinion. . . . Thus have I, by the grace of God, preserved myself entire, without anxiety or trouble of conscience, in the ancient belief of our religion, amidst so many sects and divisions as our age has produced."

Far from being religious as Montaigne was, the agnostic may be a skeptic about faith as well as reason. He may look upon faith either as superstition or as the exercise of the will to believe with regard to the unknowable and the

unintelligible—almost wishful thinking. He may even go so far as to treat religion as if it were pathological.

Freud, for example, regards religion as an illusion to be explained in terms of man's need to create gods in his own image—to find a surrogate for the father, on whom his infantile dependence can be projected. Freud finds confirmation for this in the fact that in the religions of the west, God "is openly called Father. Psychoanalysis," he goes on, "concludes that he really is the father, clothed in the grandeur in which he once appeared to the small child."

Though the grown man "has long ago realized that his father is a being with strictly limited powers and by no means endowed with every desirable attribute," Freud thinks that he nevertheless "looks back to the memory-image of the overrated father of his childhood, exalts it into a Deity, and brings it into the present and into reality. The emotional strength of this memory-image and the lasting nature of his need for protection"—for, as Freud explains, "in relation to the external world he is still a child"—"are the two supports of his belief in God."

AT THE OTHER extreme from agnosticism is, as the name implies, gnosticism. Like deism, it dispenses with faith, but it exceeds traditional deism in the claims it makes for reason's power to penetrate the divine mysteries. Between exclusive reliance on faith and an exaltation of reason to the point where there is no need for God to reveal anything, a middle ground is held by those who acknowledge the contributions of both faith and reason. Those who try to harmonize the two usually distinguish between the spheres proper to each, and formulate some principle according to which they are related to each other in an orderly fashion.

Whatever is purely a matter of faith, Aquinas says, is assented to solely because "it is revealed by God." The articles of Christian faith are typified by "the Trinity of Persons in Almighty God, the mystery of Christ's Incarnation, and the like." With regard to such matters, which Aquinas thinks belong primarily to faith, some auxiliary use can be made of reason, "not, indeed, to prove faith," he explains, but to make clear the things that follow from it. Certain

matters, such as God's existence and attributes, he classifies as belonging to "the preambles to faith" because they fall, in his view, within reason's power to demonstrate, unaided by faith. Yet even here he does not assign the affirmation of the truth to reason alone.

Just as "it was necessary for the salvation of man that certain truths which exceed human reason should be made known to him by divine revelation," so even with regard to "those truths about God which human reason can investigate," Aquinas thinks it was also necessary that "man be taught by a divine revelation. For the truth about God, such as reason can know it, would only be known by a few, and that after a long time, and with the admixture of many errors." Because "human reason is very deficient in things concerning God"—"a sign of which is that philosophers . . . have fallen into many errors and have disagreed among themselves"—men would have no knowledge of God "free from doubt and uncertainty" unless all divine truths were "delivered to them by the way of faith, being told to them, as it were, by God Himself Who cannot lie."

In different ways faith supports reason and reason helps faith. On matters which belong to both reason and faith, faith provides a greater certitude. On matters strictly of faith, reason provides some understanding, however remote and inadequate, of the mysteries of religion. "The use of human reason in religion," Bacon writes, "is of two sorts: the former, in the conception and apprehension of the mysteries of God to us revealed; the other, in the inferring and deriving of doctrine and direction thereupon. . . . In the former we see God vouchsafeth to descend to our capacity, in the expressing of his mysteries in sort as may be sensible unto us; and doth gift his revelations and holy doctrine upon the notions of our reason and applieth his inspiration to open our understanding, as the form of the key to the ward of the lock. For the latter, there is allowed us an use of reason and argument, secondary and respective, although not original and absolute. For after the articles and principles of religion are placed and exempted from examination of reason, it is then permitted unto us to make derivations and inferences from and ac-

according to the analogy of them, for our better direction."

In addition to all discursive knowledge of God, whether it be by faith or by reason, there is the totally incommunicable and intimate acquaintance with the supernatural which the mystic claims for his vision in moments of religious ecstasy or which is promised to the blessed as their heavenly beatitude. When, at the culmination of *Paradise*, Dante sees God, "my vision," he declares, "was greater than our speech."

Knowing that his "speech will fall more short . . . than that of an infant who still bathes his tongue at the breast," he tries nevertheless to communicate in words "one single spark of Thy glory for the folk to come." In the presence of God, he writes, his mind, "wholly rapt, was gazing fixed, motionless, and intent, and ever with gazing grew enkindled. In that Light one becomes such that it is impossible he should ever consent to turn himself from it for other sight; because the Good which is the object of the will is all collected in it, and outside of it that is defective which is perfect there."

THE ARGUMENTS FOR the existence of the gods or of one God constitute one of the greatest attempts of the human mind to go beyond the sensible or phenomenal world of experience. The attempt has been made in every age and by minds of quite different persuasions in religious belief or philosophical outlook. It is possible, nevertheless, to classify the arguments into two or three main types.

Within the domain of pure or speculative reason there seem to be two ways of approaching the problem of God's existence.

One is in terms of the conception of God as an infinite, perfect, and necessary being, whose non-existence is therefore inconceivable. According to Anselm, God cannot be conceived in any other way than as "a being than which nothing greater can be conceived." But since "the fool hath said in his heart, there is no God," how shall he be made to know that the God, which exists in his understanding at the moment when he denies His real existence, also really exists outside his understanding? "For it is one thing for an object to be in the understanding, and another to understand that the

object exists." Hence Anselm considers the consequence of supposing that God exists in the understanding alone.

"If that, than which nothing greater can be conceived," he argues, "exists in the understanding alone, the very being, than which nothing greater can be conceived, is one than which a greater can be conceived"—for to exist in reality as well as in the understanding is to have *more* being. But this leads to "an irreconcilable contradiction," since "if that, than which nothing greater can be conceived, can be conceived not to exist, it is not that than which nothing greater can be conceived." Therefore Anselm concludes that a being "than which nothing greater can be conceived" must exist "both in the understanding and reality."

Anselm summarizes his argument by saying that "no one who understands what God is, can conceive that God does not exist." Since the non-existence of God is inconceivable, God must exist. Descartes gives the same argument a slightly different statement in terms of the inseparability of God's essence from God's existence.

"Being accustomed," he writes, "in all other things to make a distinction between existence and essence, I easily persuade myself that the existence can be separated from the essence of God, and that we can thus conceive God as not actually existing. But, nevertheless, when I think of it with more attention, I clearly see that existence can no more be separated from the essence of God than can its having its three angles equal to two right angles be separated from the essence of a rectilinear triangle, or the idea of a mountain from the idea of a valley; and so there is not any less repugnance to our conceiving a God (that is, a Being supremely perfect) to whom existence is lacking (that is to say, to whom a certain perfection is lacking), than to conceive of a mountain which has no valley."

Spinoza defines a "cause of itself" as "that whose essence involves existence; or that whose nature cannot be conceived unless existing." Since in his conception of substance, substance is necessarily infinite, it is also cause of itself. Hence he concludes that "God or substance . . . necessarily exists"; for "if this be denied, conceive if it be possible that God does not

exist. Then it follows that His essence does not involve existence. But this is absurd. Therefore God necessarily exists."

This mode of argument, which takes still other forms, is traditionally called the "ontological argument" or the "*a priori* proof" of God's existence. Its critics sometimes deny that it is an argument or proof in any sense at all. Aquinas, for example, interprets Anselm not as proving God's existence, but rather as asserting that God's existence is self-evident. Those who say that the proposition "God does not exist" is self-contradictory, are saying that the opposite proposition "God exists" must be self-evident.

Aquinas does not deny that the proposition "God exists" is intrinsically self-evident. On this point he goes further than Anselm, Descartes, and Spinoza. Where they say God's essence *involves* His existence, Aquinas asserts that in God essence and existence are *identical*. When Moses asks God, "If they should say to me, What is His name? what shall I say to them?" the Lord says unto Moses, "I AM THAT I AM," and adds, "Say to the children of Israel: HE WHO IS hath sent me to you." This name—HE WHO IS—Aquinas holds to be "the most proper name of God" because it signifies that "the being of God is His very essence."

For this reason he thinks that the proposition "God exists" is self-evident in itself. Its subject and predicate are immediately related. Nevertheless, Aquinas holds that the proposition is not self-evident to us "because we do not know the essence of God." Even supposing, he writes, "that everyone understands this name *God* as signifying something than which nothing greater can be thought, nevertheless, it does not therefore follow that he understands that what the name signifies exists actually, but only that it exists mentally. Nor can it be argued that it actually exists, unless it be admitted that there actually exists something than which nothing greater can be thought; and this precisely is not admitted by those who hold that God does not exist."

The writer of the First Set of Objections to Descartes' *Meditations* maintains that the criticism advanced by Aquinas applies to Descartes as well as to Anselm. Whether stated in

terms of the conception of an absolutely perfect being or in terms of essence and existence, the argument is invalid, he thinks, which asserts that God actually exists because His non-existence is inconceivable. Kant's later criticism of the ontological argument takes a similar course. A proposition may be logically necessary without being true in fact.

"The conception of an absolutely necessary being," he writes, "is a mere idea, the objective reality of which is far from being established by the mere fact that it is a need of reason. . . . The unconditioned necessity of a judgment does not form the absolute necessity of a thing." From the fact that "existence belongs necessarily to the object of the conception," we cannot conclude that "the existence of the thing . . . is therefore absolutely necessary—merely," Kant says, "because its existence has been cogitated in the conception. . . . Whatever be the content of our conception of an object, it is necessary to go beyond it, if we wish to predicate existence of the object. . . . The celebrated ontological or Cartesian argument for the existence of a supreme being is therefore insufficient."

THE SECOND MAIN approach to the problem of God's existence lies in the sort of proof which, Locke thinks, "our own existence and the sensible parts of the universe offer so clearly and cogently to our thoughts." He refrains from criticizing the argument from "the *idea* of a most perfect being," but he does insist that we should not "take some men's having that idea of God in their minds . . . for the only proof of a Deity." He for one prefers to follow the counsel of St. Paul, that "the invisible things of God are clearly seen from the creation of the world, being understood by the things that are made, even his eternal power and Godhead."

We have, according to Locke, an intuitive knowledge of our own existence. We know, he says, that "nonentity cannot produce any real being"; and so "from the consideration of ourselves, and what we infallibly find in our constitution, our reason leads us to the knowledge of this certain and evident truth—*That there is an eternal, most powerful, and most knowing Being.*"

Without labelling it a proof of God's existence, Augustine in his *Confessions* presents a similar argument—from the visible creation. "Behold," he says, "the heavens and the earth are; they proclaim that they were created; for they change and vary: . . . They proclaim also that they made not themselves: 'therefore we are, because we have been made; we were not therefore, before we were, so as to make ourselves' . . . Thou therefore, Lord, madest them."

This second approach to the existence of God by reasoning from the facts of experience or the evidences of nature is called the "*a posteriori* proof." In the tradition of the great books, it has been formulated in many different ways. What is common to all of them is the principle of causality, in terms of which the known existence of certain effects is made the basis for inferring the existence of a unique cause—a first cause, a highest cause, an uncaused cause.

Aristotle, for example, in the last book of his *Physics*, argues from the fact of motion or change to the existence of an unmoved mover. He sums up his elaborate reasoning on this point in the following statement. "We established the fact that everything that is in motion is moved by something, and that the movent is either unmoved or in motion, and that, if it is in motion, it is moved either by itself or by something else and so on throughout the series: and so we proceeded to the position that the first principle that directly causes things that are in motion to be moved is that which moves itself, and the first principle of the whole series is the unmoved."

Aristotle's argument, unlike that of Augustine or Locke, does not presuppose the creation of the world, at least not in the sense of the world's having a beginning. On the contrary, he holds the world and its motions to be as eternal as their unmoved mover. "It is impossible," he writes in the *Metaphysics*, "that movement should either have come into being or cease to be." Precisely because he thinks the world's motions are eternal, Aristotle holds that the prime mover, in addition to being everlasting, must be immutable. This for him means "a principle whose very essence is actuality." Only a substance without any potency, only one which is *purely actual*, can be an absolutely immutable, eternal being.

Whatever has any potentiality in its nature is capable of not existing. If everything were of this sort, nothing that now is "need be, for it is possible for all things to be capable of existing, but not yet to exist." Hence, in still another way, Aristotle seems to reach the conclusion that a purely actual being must exist; and, furthermore, he seems to identify this being with a living and thinking God. "Life also belongs to God," he writes; "for the actuality of thought is life, and God is that actuality; and God's self-dependent actuality is life most good and eternal."

Where Aristotle argues from motion and potentiality to a prime mover and a pure actuality, Newton gives the *a posteriori* proof another statement by arguing from the design of the universe to God as its designer or architect. "The most wise and excellent contrivances of things, and final causes" seem to him the best way of knowing God. "Blind metaphysical necessity, which is certainly the same always and everywhere, could produce no variety in things. All that diversity of natural things which we find suited to different times and places could arise from nothing but the ideas and will of a Being necessarily existing."

In similar fashion Berkeley maintains that "if we attentively consider the constant regularity, order, and concatenation of natural things, the surprising magnificence, beauty, and perfection of the larger, and the exquisite contrivance of the smaller parts of the creation, together with the exact harmony and correspondence of the whole, but, above all, the never enough admired laws of pain and pleasure, and the instincts or natural inclinations, appetites, and passions of animals; I say if we consider all these things, and at the same time attend to the meaning and import of the attributes, one, eternal, infinitely wise, good, and perfect, we shall clearly perceive that they belong to the . . . Spirit, who 'works all in all,' and 'by whom all things consist.'" This seems to him so certain that he adds, "we may even assert that the existence of God is far more evidently perceived than the existence of men."

But, according to Berkeley, all the visible things of nature exist only as ideas in our minds, ideas which, unlike our own memories or imaginations, we do not ourselves produce. "Every-

thing we see, hear, feel, or anywise perceive by sense," he writes, must have some other cause than our own will, and is therefore "a sign or effect of the power of God." To the "unthinking herd" who claim that "they cannot *see* God," Berkeley replies that "God . . . is intimately present to our minds, producing in them all that variety of ideas or sensations which continually affect us."

The existence of any idea in us is for Berkeley ground for asserting God's existence and power as its cause. But for Descartes *one* idea alone becomes the basis of such an inference. He supplements his *a priori* or ontological argument with what he calls an "*a posteriori* demonstration of God's existence from the mere fact that the idea of God exists in us."

That he is himself imperfect, Descartes knows from the fact that he doubts. Even when doubting leads to knowledge, his knowledge is imperfect, "an infallible token" of which, he says, is the fact that "my knowledge increases little by little." But the idea which he has of God, he declares, is that of an absolutely perfect being, "in whom there is nothing merely potential, but in whom all is present really and actually." On the principle that there cannot be more reality or perfection in the effect than in the cause, Descartes concludes that his own imperfect mind cannot be the cause of the idea of a perfect being. "The idea that I possess of a being more perfect than I," he writes, "must necessarily have been placed in me by a being which is really more perfect."

The radical imperfection of man, and indeed of all creation, offers Augustine still another proof for God's existence, which he attributes to the "Platonists." "They have seen," he writes, "that whatever is changeable is not the most high God, and therefore they have transcended every soul and all changeable spirits in seeking the supreme. They have seen also that, in every changeable thing, the form which makes it that which it is, whatever be its mode or nature, can only *be* through Him who truly *is*, because He is unchangeable. And therefore, whether we consider the whole body of the world, its figure, qualities, and orderly movement, and also all the bodies which are in it; or whether we consider all life, either that

which nourishes and maintains, as the life of trees; or that which, besides this, has also sensation, as the life of beasts; or that which adds to all these intelligence, as the life of man; or that which does not need the support of nutriment, but only maintains, feels, understands, as the life of angels—all can only *be* through Him who absolutely *is*. For to Him it is not one thing to *be*, and another to live, as though He could *be*, not living; nor is it to Him one thing to live, and another to understand, as though He could live, not understanding; nor is it to Him one thing to understand, another to be blessed, as though He could understand and not be blessed. But to Him to live, to understand, to be blessed, are to *be*. They have understood, from this unchangeableness and this simplicity, that all things must have been made by Him, and that He could Himself have been made by none."

The variety of arguments we have so far examined seems to fit the "five ways" in which, according to Aquinas, the existence of God can be proved *a posteriori*. "The first and most manifest way is the argument from motion," which Aquinas attributes to Aristotle. "The second way is from the nature of an efficient cause." Berkeley's argument or Locke's would seem, in some respects, to offer a version of this mode of reasoning. "The third way is taken from possibility and necessity," and seems to develop the argument from potentiality in Aristotle's *Metaphysics*, and to contain the inference from mutability and contingency which is implicit in the argument attributed to the Platonists by Augustine. "The fourth way is taken from the gradation to be found in things." Proceeding from the existence of the imperfect to absolute perfection, it resembles in principle the reasoning of Descartes concerning the perfection in the cause relative to the perfection in the effect. "The fifth way is taken from the governance of the world"—from the fact that everything acts for an end—and so is like the argument which Newton offers from final causes and the existence of order in the universe.

These "five ways" may or may not be regarded as an exhaustive list of the *a posteriori* proofs. It may even be questioned whether the five ways are logically distinct and independ-

ent. Aquinas himself says that "in speculative matters the medium of demonstration, which demonstrates the conclusion perfectly, is only one; whereas probable means of proof are many." Since he considers the argument for God's existence to be a certain, not a probable proof, it would seem to follow that, in strict logic, only one principle can be involved in that proof.

As already suggested, the principle—common to all the various ways in which such a *a posteriori* reasoning is expressed—seems to be the principal of causality. This appears in the argument from the existence of contingent beings, which cannot cause their own being, to the existence of a being which needs no cause of its being, because its very essence is to exist. This may be the one argument for God's existence or, if one among many, it may be the core of all the others. It has the distinction at least of conceiving God as the cause of being, rather than of motion or of hierarchy and order in the world.

According to the statement of Aquinas that "being is the proper effect of God," it establishes God as the *unique* and *direct* cause of the being possessed by every finite thing. This formulation of the proof is more fully examined in the chapter on NECESSITY AND CONTINGENCY; and its relation to the question of whether the world had a beginning or is eternal, and if eternal, whether it is created or uncreated, will be seen in the chapters on CAUSE, ETERNITY, and WORLD.

THE VALIDITY OF the *a posteriori* argument for God's existence—in one form or another—is questioned by those who think that the causal principle cannot be applied beyond experience, or who think that our knowledge of cause and effect is not sufficient to warrant such inferences.

"The existence of any being can only be proved by arguments from its cause or its effect," Hume writes; "and these arguments are founded entirely on experience. . . . It is only experience which teaches us the nature and bounds of cause and effect, and enables us to infer the existence of one object from that of another." But Hume doubts "whether it be possible for a cause to be known only by its

effect . . . or to be of so singular and particular a nature as to have no parallel and no similarity with any other cause or object, that has ever fallen under our observation. . . . If experience and observation and analogy be, indeed, the only guides which we can reasonably follow in inferences of this nature," as Hume thinks is the case, then it follows that "both the effect and the cause must bear a similarity and resemblance to other effects and causes which we know.

"I leave it to your own reflection," he adds, "to pursue the consequences of this principle." One seems obvious enough; namely, that God—a unique and unparalleled cause—cannot be proved by reasoning from our experience of effects and their causes. Hume himself draws this conclusion when he declares that theology, insofar as it is concerned with the existence of a Deity, has "its best and most solid foundation," not in reason or experience, but in "*faith* and divine revelation."

Like Hume, Kant thinks that our notions of cause and effect cannot be applied outside experience or to anything beyond the realm of sensible nature. But he offers an additional reason for denying validity to all a *a posteriori* reasoning concerning God's existence. "It imposes upon us," he says, "an old argument in a new dress, and appeals to the agreement of two witnesses, the one with the credentials of pure reason, and the other with those of empiricism; while, in fact, it is only the former who has changed his dress and voice."

The principle of the argument from the contingency of the world or its parts Kant states as follows: "If something exists, an absolutely necessary being must likewise exist." One premise in the argument, namely, that contingent things exist, has its foundation in experience and therefore Kant admits that the reasoning "is not completely *a priori* or ontological." But in order to complete the proof, he thinks it must be shown that an *ens realissimum*, or most perfect being, is the same as an absolutely necessary being, in order for the obtained conclusion (*a necessary being exists*) to be translated into the conclusion desired (*God exists*).

That "an *ens realissimum* must possess the additional attribute of absolute necessity"—or, in other words, that a perfect being is identical

with one which necessarily exists—is, according to Kant, “exactly what was maintained in the ontological argument.” Hence he maintains that the argument from contingency is invalid because it cannot avoid including what is for Kant the invalid premise of the ontological argument as “the real ground of its disguised and illusory reasoning.”

THE CONTROVERSY concerning the proof of God’s existence raises issues in logic, in metaphysics and physics, and in the theory of knowledge. Philosophers are opposed on the question whether a valid demonstration is possible. Those who think it possible differ from one another on the way in which the proof should be constructed. Those who think it impossible do not always go to the opposite extreme of making the affirmation of God’s existence a matter of faith; or of denying with the skeptic that we can have any light on the question at all. Pascal and Kant, for example, reject the theoretic arguments as inconclusive or untenable, but they do not think the problem is totally insoluble. They offer instead *practical* grounds or reasons for accepting God’s existence.

“The metaphysical proofs of God are so remote from the reasoning of men,” Pascal asserts, “and so complicated, that they make little impression.” He will “not undertake,” he tells us in his *Pensées*, “to prove by natural reasons . . . the existence of God.” In his view “there are only three kinds of persons: those who serve God, having found Him; others who are occupied in seeking Him, not having found Him; while the remainder live without seeking Him, and without having found Him.” Since he regards the first as “reasonable and happy,” the last as “foolish and unhappy,” he addresses himself to the middle group whom he regards as “unhappy and reasonable.”

He asks them to consider whether God is or is not. “Reason can decide nothing here,” he says. If a choice is to be made by reason, it must be in the form of a wager. “Which will you choose then? Let us see. Since you must choose, let us see which interests you least. You have two things to lose, the true and the good; and two things to stake, your reason and your will, your knowledge and your happiness; and your

nature has two things to shun, error and misery. Your reason is no more shocked in choosing one rather than another, since you must of necessity choose. This is one point settled. But your happiness? Let us weigh the gain and the loss in wagering that God is. Let us estimate these two chances. If you gain, you gain all, if you lose, you lose nothing. Wager then, without hesitation, that He is.”

We are incapable of knowing either that God is or what God is, according to Pascal, because “if there is a God, He is infinitely incomprehensible” and “has no affinity to us.” Nevertheless, proceeding on the practical level of the wager, reason may lead to Christian faith, yet not in such a way as to give adequate reasons for that belief, since Christians “profess a religion for which they cannot give a reason.”

Kant also makes the affirmation of God a matter of faith, but for him it is a “purely rational faith, since pure reason . . . is the sole source from which it springs.” He defines a *matter of faith* as any object which cannot be known through the speculative use of reason, but which “must be thought *a priori*, either as consequences or as grounds, if pure practical reason is to be used as duty commands . . . Such is the *summum bonum*,” he says, “which has to be realized in the world through freedom . . . This effect which is commanded, *together with the only conditions on which its possibility is conceivable by us*, namely, the existence of God and the immortality of the soul, are *matters of faith* and are of all objects the only ones that can be so called.”

For Kant, then, the existence of God is a “postulate of pure practical reason . . . as the necessary condition of the possibility of the *summum bonum*.” The moral law commands us to seek the highest good, with perfect happiness as its concomitant; but Kant thinks that “there is not the slightest ground in the moral law for a necessary connexion between morality and proportionate happiness in a being that belongs to the world as a part of it.” Since man is a part of the world or nature, and dependent on it, “he cannot by his will be a cause of this nature, nor by his own power make it thoroughly harmonize, as far as his happiness is concerned, with his practical principles.” The only possible solution lies in “the existence of a

cause of all nature, distinct from nature itself, and containing the principle of this connexion, namely, of the exact harmony of happiness with morality." That is why, Kant explains, "it is morally necessary to assume the existence of God."

IN THE TRADITION of the great books, the common ground shared by reason and faith is marked by the convergence of the contributions made by pagan, Jew, and Christian—and by poets, philosophers, and theologians—to the problem of God's existence and the understanding of the divine nature, the essence of God and His attributes.

Certain attributes of God, such as simplicity, immateriality, eternity, infinity, perfection, and glory, are usually regarded as so many different ways in which the human understanding apprehends the divine nature in itself. Other attributes, such as the divine causality, omnipotence, omnipresence, omniscience, love, justice, and mercy, are usually taken as ways of considering God's nature in relation to the world or to creatures. But to divide the attributes in this way, as is done in the Outline of Topics, is to make a division which cannot be fully justified except in terms of convenience for our understanding. God's will, for example, no less than God's intellect, can be considered in relation to Himself. God's intellect, no less than God's will, can have the world for its object. So, too, the divine goodness can be considered with reference to things, even as God's love can be considered with reference to Himself.

The difficulties we meet in classifying or ordering the attributes of God confirm the opinion of almost all theologians, that our understanding is inadequate to comprehend the essence of God. The fact that we employ a multiplicity of attributes to represent to ourselves what in itself is an absolute unity is another indication of the same point. The one attribute of *simplicity* would seem to deny us the right to name others, unless we take the plurality of attributes to signify something about man's understanding of God rather than a real complexity in the divine nature.

"He that will attribute to God," Hobbes writes, "nothing but what is warranted by

natural reason, must either use such negative attributes, as *infinite, eternal, incomprehensible*; or superlatives, as *most high, most great*, and the like; or indefinite, as *good, just, holy, creator*; and in such sense, as if he meant not to declare what He is (for that were to circumscribe Him within the limits of our fancy), but how much we admire Him, and how ready we would be to obey Him; which is a sign of humility and of a will to honor Him as much as we can: for there is but one name to signify our conception of His nature, and that is, I AM: and but one name of His relation to us, and that is GOD; in which is contained Father, King, and Lord."

Even when they are discussed by the philosophers and reflected on by the poets, certain matters belong especially to theology because they constitute the dogmas of religion—articles of religious faith based solely on divine revelation, not discovered by human inquiry or speculation. That God created the world out of nothing and of His free will; that the world had a beginning and will have an end are, for example, dogmas of traditional Judaism and Christianity. Philosophers may argue about the freedom or necessity of the creative act, or about the possibility of a beginning or an end to time and the world, but Jewish and Christian theologians find in Sacred Scripture the warrant for believing that which may not be thoroughly intelligible to reason, much less demonstrable by it. What is true of creation applies generally to the religious belief in divine providence and the positive commandments of God, to the gift of grace which God bestows upon men, and to the performance of miracles.

Judaism and Christianity share certain dogmas, though the degree to which Jewish and Christian theologians commonly understand what is apparently the same dogma varies from great similarity of interpretation (as in the case of creation and providence) to differences so great (as, for example, with regard to grace) that there may be some doubt whether the dogma in question is really the same. The line of demarcation between these faiths would seem to be more easily determined than their common ground; yet even here such matters as the resurrection of the body—even when we take differences of interpretation into account—may be regarded as a dogma shared by both.

The basic differences between Jewish and Christian theology center, of course, on the issue between a unitarian and a trinitarian conception of the Godhead, with immediate consequences for disbelief or belief in Christ as the incarnate second person of the Trinity—the Word become flesh. This in turn has consequences for doctrines of salvation, and of the nature and mission of the church, its rituals and its sacraments. Even within Christianity, however, there have been and still are serious doctrinal differences on all these matters. The most fundamental heresies and schisms of early Christianity concerned the understanding of the Trinity and the Incarnation. The great modern schism which divided Christendom arose from issues about the sacraments, the organization and practices of the church, and the conditions of salvation.

It would seem to be just as easy to say what beliefs are common to religious Jews and Christians, as to articulate the faith common to all sects of Christianity. If all varieties of Protestant doctrine are included, little remains in common except belief in the God of Abraham, Isaac, and Jacob—creator and provider, governor and judge, dispenser of rewards and punishments.

ONE BOOK STANDS OUT from all the rest because, in our tradition, it is—as the use of “Bible” for its proper name implies—the book about God and man. For those who have faith, Holy Writ or Sacred Scripture is the revealed Word of God. Its division into Old and New Testaments represents the historic relation of the Jewish and Christian religions.

Without prejudice to the issue between belief and unbelief, or between Jewish and Chris-

tian faith, we have attempted to organize the references to specifically religious doctrines concerning God and His creatures according to their origin and foundation in either the Old or in the New Testament, or in both. On certain points, as we have already seen, the line of distinction can be clearly drawn. For example, the doctrines of God’s covenant with Israel, of the Chosen People, of the Temple and the Torah, are indisputably drawn from the Old Testament; and from the New Testament come such dogmas as those concerning Christ’s divinity and humanity, the Virgin Birth, the Church as the mystical body of Christ, and the seven sacraments.

Under all these topics we have assembled passages from the Bible, interpretations of them by the theologians, and materials from the great books of poetry and history, philosophy and science. Since the criterion of relevance here is the reflection of sacred or religious doctrine in secular literature, the writings of pagan antiquity are necessarily excluded, though they are included in the more philosophical topics of theology, such as the existence and nature of one God.

Despite its length, this chapter by no means exhausts the discussion of God in the great books. The long list of Cross-References, which follows the seventy-three topics comprising the Reference section of this chapter, indicates the various ways in which the idea of God occurs in the topics of other chapters. The reader will find that list useful not only as an indication of the topics in other chapters which elaborate on or extend the discussion of matters treated here, but also as a guide to other Introductions in which he is likely to find the conception of God a relevant part of the examination of some other great idea.

OUTLINE OF TOPICS

	PAGE
1. The polytheistic conception of the supernatural order	561
1a. The nature and existence of the gods	
1b. The hierarchy of the gods: their relation to one another	562
1c. The intervention of the gods in the affairs of men: their judgment of the deserts of men	

	PAGE
2. The existence of one God	563
2a. The revelation of one God	
2b. The evidences and proofs of God's existence	564
2c. Criticisms of the proofs of God's existence: agnosticism	
2d. The postulation of God: practical grounds for belief	565
3. Man's relation to God or the gods	
3a. The fear of God or the gods	
3b. The reproach or defiance of God or the gods	
3c. The love of God or the gods	566
3d. Obedience to God or the gods	567
3e. The worship of God or the gods: prayer, propitiation, sacrifice	568
3f. The imitation of God or the gods: the divine element in human nature; the deification of men; man as the image of God	569
4. The divine nature in itself: the divine attributes	570
4a. The identity of essence and existence in God: the necessity of a being whose essence involves its existence	571
4b. The unity and simplicity of the divine nature	
4c. The immateriality of God	572
4d. The eternity and immutability of God	
4e. The infinity of God: the freedom of an infinite being	573
4f. The perfection or goodness of God	
4g. The intellect of God	574
4h. The happiness and glory of God	
5. The divine nature in relation to the world or creatures	575
5a. God as first and as exemplar cause: the relation of divine to natural causation	
5b. God as final cause: the motion of all things toward God	576
5c. The power of God: the divine omnipotence	577
5d. The immanence of God: the divine omnipresence	578
5e. The transcendence of God: the divine aseity	
5f. God's knowledge: the divine omniscience; the divine ideas	579
5g. God's will: divine choice	580
5h. God's love: the diffusion of the divine goodness	
5i. Divine justice and mercy: divine rewards and punishments	581
6. Man's knowledge of God	583
6a. The names of God: the metaphorical and symbolic representations of God; the anthropomorphic conception of God	584
6b. Natural knowledge: the use of analogies; the evidences of nature; the light of reason	

6c. Supernatural knowledge	585
(1) God as teacher: inspiration and revelation	
(2) The light of faith	586
(3) Mystical experience	587
(4) The beatific vision	
7. Doctrines common to the Jewish, Mohammedan, and Christian conceptions of God and His relation to the world and man	588
7a. Creation	
7b. Providence	
7c. Divine government and law	589
7d. Grace	590
7e. Miracles	591
7f. The Book of Life	592
7g. The resurrection of the body	
7h. The Last Judgment and the end of the world	
8. Specifically Jewish doctrines concerning God and His people	593
8a. The Chosen People: Jew and gentile	
8b. God's Covenant with Israel: circumcision as sign of the Covenant	
8c. The Law: its observance as a condition of righteousness and blessedness	594
8d. The Temple: the Ark of the Torah	
8e. The messianic hope	595
9. Specifically Christian dogmas concerning the divine nature and human destiny	
9a. The Trinity	
9b. The Incarnation: the God-man	596
(1) The divinity of Christ	
(2) The humanity of Christ	597
(3) Mary, the Mother of God	
9c. Christ the Saviour and Redeemer: the doctrines of original sin and salvation	
9d. The Church: the mystical body of Christ; the Apostolate	598
9e. The sacraments	599
9f. The second coming of Christ	
10. The denial of God or the gods, or of a supernatural order: the position of the atheist	
11. The denial of God as completely transcending the world or nature: the position of the pantheist	600
12. The denial of a revealed and providential God: the position of the deist	
13. God as a conception invented by man: its emotional basis	
14. The worship of false gods: deification and idolatry	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The polytheistic conception of the supernatural order

1a. The nature and existence of the gods

Chapter 30: GOOD AND EVIL

INTRODUCTION

THE theory of good and evil crosses the boundaries of many sciences or subject matters. It occupies a place in metaphysics. It is of fundamental importance in all the moral sciences—ethics, economics, politics, jurisprudence. It appears in all the descriptive sciences of human behavior, such as psychology and sociology, though there it is of less importance and is differently treated.

The relation of good and evil to truth and falsity, beauty and ugliness, carries the discussion into logic, aesthetics, and the philosophy of art. The true, it has been said, is the good in the sphere of our thinking. So it may be said of the beautiful that it is a quality which things have when they are good as objects of contemplation and love, or good as productions. It is no less possible to understand goodness and beauty in terms of truth, or truth and goodness in terms of beauty.

One aim of analysis, with respect to the true, the good, and the beautiful, is to preserve their distinctness without rendering each less universal. This has been attempted by writers who treat these three terms as having a kind of parallelism in their application to everything, but who also insist that each of the three notions conceives things under a different aspect or in a different relation. "As good adds to being the notion of the desirable," Aquinas writes, "so the true adds a relation to the intellect"; and it is also said that the end "of the appetite, namely good, is in the desirable thing," whereas the end "of the intellect, namely the true, is in the intellect itself."

In that part of theology which goes beyond metaphysics and moral philosophy, we meet with the concept of infinite goodness—the goodness of an infinite being—and we then face the problem of how God's goodness is to be understood by man. The basic terms of moral

theology—righteousness and sin, salvation and damnation—are, like virtue and vice, happiness and misery, conceptions of good and evil in the condition of man. (Their special theological significance comes from the fact that they consider the goodness or evil of man in terms of his relation to God.) But the theological problem which is traditionally called "the problem of evil" concerns the whole universe in its relation to the divine perfection.

That problem, which is further discussed in the chapter on *WORLD*, can be formulated in a number of ways. How are we to understand the existence of evil in a world created by a God who is omnipotent and perfectly good? Since God is good and since everything which happens is within God's power, how can we account for the sin of Satan or the fall of man, with all the evil consequent thereupon, without limiting God's power or absolving the erring creature from responsibility? Can it be said that this is the best of all possible worlds, if it is also true that this world is far from perfectly good, and if, as certain theologians hold, "God could make other things, or add something to the present creation, and then there would be another and a better universe"?

THE CONTEMPORARY discussion of good and evil draws its terminology from economics rather than theology. The word "value" has almost replaced "good" and "evil." What in other centuries were the various moral sciences are now treated as parts of the general theory of value. The substitution of "value" for "good" or of "value judgment" for "moral judgment" reflects the influence of economics.

According to Marx, Aristotle "was the first to analyse . . . the form of value." As indicated in the chapter on *WEALTH*, economics at its origin was treated by Aristotle, along with eth-

ics and politics, as a moral discipline. But he made it subordinate to them because it dealt not with the whole of human welfare, but only with wealth—one of the goods.

In the modern development of economics, the word "goods" comes to have a special significance. It refers to commodities or utilities, as in the phrase "goods and services." More generally, anything which is useful or exchangeable has the character of an economic good. This general sense is usually conveyed by the economist's use of the word "value." According to Adam Smith, "the word *value* . . . has two different meanings, and sometimes expresses the utility of some particular object, and sometimes the power of purchasing other goods which the possessor of that object conveys." These two meanings are distinguished as "value in use" and "value in exchange." Marx accepts this distinction, but thinks that there is a more fundamental notion of value. He thinks it is possible to abstract from both use-value and exchange-value, and to discover the underlying property which gives value to all exchangeable things, namely, that they are products of labor.

With Smith and Marx, as with Aristotle, the theory of value does not deal with every type of good, but only with that type which earlier moralists called "external goods" or "goods of fortune." But more recently the concept of value has been extended, by economists and others, to the evaluation of everything which men think of as desirable in any way. In consequence, the age-old controversy about the objectivity or subjectivity of good and evil is now stated in terms of the difference between facts and values, or between judgments of fact and judgments of value.

The issue, as currently stated, is whether questions of value can be answered in the same way as questions of fact. One position maintains that, unlike questions of fact which can be answered by scientific investigation and can be objectively solved, questions of value elicit no more than expressions of opinion, relative to the individual's subjective response or to the conventions of his society at a given time. The other side of the issue is held by those who insist that the norms of value are as objective and as scientifically determinable as the criteria of fact or existence.

THE WORD "VALUE" does not change the problem in any way; for what does evaluating anything mean except judging it as good or bad, better or worse? The problem, which has a history as long as the tradition of the great books, is the problem of how we can defend such judgments and what they signify about the things judged. Are good and evil determined by nature or convention? Are they objects of knowledge or opinion?

The title of an essay by Montaigne—"that the taste for good and evil depends in good part upon the opinion we have of them"—indicates one set of answers to these questions. "If evils have no admission into us," he writes, "but by the judgment we ourselves make of them, it should seem that it is, then, in our power to despise them or to turn them to good. . . . If what we call evil and torment is neither evil nor torment of itself, but only that our fancy gives it that quality, it is in us to change it." Echoing Montaigne, Hamlet remarks that "there is nothing either good or bad but thinking makes it so." The Greek sophists, centuries earlier, appear to take the same view. The statement of Protagoras that "man is the measure of all things," Plato thinks, does not significantly apply to *all* things, but only to such things as the good or the right, the true or the beautiful. In the *Theaetetus*, Protagoras is made to say that as "to the sick man his food appears to be bitter, and to the healthy man the opposite of bitter," so in general men estimate or judge all things according to their own condition and the way things affect them. This theory of good and evil necessarily denies the possibility of moral science. Socrates calls it "a high argument in which all things are said to be relative."

Plato and Aristotle respond to the sophists by arguing in the opposite vein. For Plato, the good is not a matter of opinion, but an object of knowledge. Knowledge of good and evil is the best fruit of the tree of knowledge. "Let each one of us leave every other kind of knowledge," Socrates says at the end of the *Republic*, "and seek and follow one thing only," that is, "to learn and discern between good and evil."

Aristotle does not think that ethics, or any science which deals with good and evil, can have as much precision as mathematics. "Our discus-

sion will be adequate," he writes, "if it has as much clearness as the subject matter admits of, for precision is not to be sought for alike in all discussions." This, however, does not exclude the possibility of our knowing with great exactitude the first principles of moral science, such as the nature of happiness and virtue. Indefiniteness and even a certain kind of relativity occur only when these principles are applied to particular cases. Hence, in Aristotle's view, the moral sciences, such as ethics and politics, can have objective and universal validity no less than physics or mathematics, at least on the level of principles.

In modern times, Locke and Kant also affirm the scientific character of ethics, but without the qualification which Aristotle insists upon when we go from principles to practice. Locke explains the grounds on which he is "bold to think that morality is capable of demonstration, as well as mathematics"; for, he says, "the precise real essence of the things moral words stand for may be perfectly known, and so the congruity and incongruity of the things themselves may be certainly discovered; in which consists perfect knowledge." He is confident that "from self-evident propositions, by necessary consequences, as incontestible as those in mathematics, the measures of right and wrong might be made out, to any one that will apply himself with the same indifferency and attention to the one as he does to the other of these sciences." But Locke adds, "this is not to be expected, whilst the desire of esteem, riches, or power makes men espouse the well-endowed opinions in fashion." He himself seems to tend in the opposite direction when he identifies the good with the pleasant and makes it relative to individual desires.

For Kant the two major parts of philosophy—physics and ethics—are on equal footing, the one concerned with the "laws of *nature*," the other with the "laws of *freedom*." In each case there is both empirical and *a priori* knowledge. Kant calls the latter in each case "metaphysics" and speaks of "a *metaphysic of nature* and a *metaphysic of morals*." The nature of science, he thinks, requires us to "separate the empirical from the rational part, and prefix to physics proper (or empirical physics) a metaphysic of nature, and to practical anthropology a meta-

physic of morals, which must be carefully cleared of everything empirical."

This partial inventory of thinkers who stand against skepticism or relativism in the field of morals indicates that agreement on this point is accompanied by some disagreement about the reasons for holding what appears to be the same view. The opposite view seems also to be shared by thinkers of quite different cast, such as Spinoza and Mill, who differ from each other as well as from Montaigne and the ancient sophists.

The terms "good and evil," Spinoza writes, "indicate nothing positive in things considered in themselves, nor are they anything else than modes of thought . . . One and the same thing may at the same time be both good and evil or indifferent"—according to the person who makes the judgment of it. Spinoza therefore defines "good" as "that which we certainly know is useful to us." Apart from society, he says, "there is nothing which by universal consent is good or evil, since everyone in a natural state consults only his own profit." Only when men live together in a civil society under law can it be "decided by universal consent what is good and what is evil."

Holding that all men seek happiness and that they determine what is good and evil in particular cases by reference to this end, Mill seems to offer the standard of utility as an objective principle of morality. But insofar as he identifies happiness with a sum total of pleasures or satisfactions, it tends to become relative to the individual or the group. If competent judges disagree concerning which of two pleasures is the greater or higher, there can be no appeal, Mill says, except to the verdict of the majority. To this extent at least, judgments of value are expressions of opinion, not determinations of science. Nor does Mill hesitate to say that "the ultimate sanction of all morality" is "a subjective feeling in our minds."

IN ORDER to clarify this basic issue it is necessary to take note of other terms which are usually involved in the discussion of good and evil—such terms as pleasure and pain, desire and aversion, being, nature, and reason. In the course of doing this, we will perceive the relevance of the chapters which deal with those ideas.

It has been said, for example, that the good is identical with the pleasant; that the good is what men desire; that the good is a property of being or existence; that the good is that which conforms to the nature of a thing; that the good is that which is approved by reason. It is possible to see some truth in each of these statements. But each, taken by itself, may be too great a simplification. Searching questions can be asked by those who refuse to equate the good with the pleasant or the desirable, the real, the natural, or the reasonable. Are there no pleasures in any way bad, no pains in any way good? Are all desires themselves good, or are all equally good? How does calling a thing "good" add anything to its being or existence? Does not evil exist or qualify existence? By what standards can the natural and the rational be judged good, if the good is that which conforms to nature and reason?

These questions call for more analysis of each of these factors in the discussion of good and evil and suggest that no one of these factors *by itself* is sufficient to solve the problem of defining good and evil or formulating their criteria. Of the five things mentioned, two particularly—pleasure and desire—seem to leave open the question whether good and evil are objective or subjective. They require us to decide whether things please us *because they are good* or are good *because they please us*; whether we desire things because they are good or simply call them "good" when we desire them. On this issue Spinoza flatly declares that "we do not desire a thing because we adjudge it good, but, on the contrary, we call it good because we desire it." In saying that "a thing is good so far as it is desirable," Aquinas takes the opposite position, for according to him "a thing is desirable only in so far as it is perfect." It can be desirable, therefore, without being actually desired by this or that individual.

The other three terms—unlike pleasure and desire—seem to favor the objectivity of good and evil, at least for those who regard the order of existence, the nature of things, and the laws of reason as independent of our desires or preferences. Thus for Spinoza the *nature* of man and his *reason* seem to provide an objective standard for determining what is good alike for all men. Nothing, he writes, "can be good ex-

cept in so far as it agrees with our nature, and therefore the more an object agrees with our nature the more profitable it will be." And in another place he says, "By *good* I understand . . . everything which we are certain is a means by which we may approach nearer and nearer to the model of human nature we set before us." That model, he tells us, is the man of reason, the man who always acts "according to the dictates of reason," for "those desires which are determined by man's power or reason are always good."

Nevertheless, if desire and pleasure cannot be eliminated from the consideration of good and evil—at least not the good and evil which enter into human life—then the problem of finding a purely objective foundation for our moral judgments is not solved simply by an appeal to being, nature, and reason.

Some help toward a solution may be found in one often reiterated fact about the relation between the good and human desire. The ancients insist that no man desires anything but what at the time *seems* good to him in some way. "No man," Socrates observes, "voluntarily pursues evil, or that which he thinks to be evil. To prefer evil to good is not in human nature; and when a man is compelled to choose one of two evils, no one will choose the greater when he may have the less." This, however, does not prevent men from desiring "what they suppose to be goods although they are really evils." Since they are mistaken in their judgment "and suppose the evils to be goods, they really desire goods."

The object consciously desired is always at least *apparently* good. When men are mistaken in their estimate of things as beneficial or injurious to themselves, the apparent good—the good actually desired—will be really an evil, that is, something actually undesirable. An object which is really good may not appear to be so, and so it will not be desired although it is desirable. The deception of appearances, Socrates says, tricks us into taking "at one time the things of which we repent at another, both in our actions and in our choice of things great and small."

THE DISTINCTION between the *real* and the *apparent* good is, of course, connected with the

problem of the objective and the subjective good. The apparent good varies from individual to individual and from time to time. If there were a real good, it would be free from such relativity and variability. Unless there are real, as distinct from merely apparent, goods, moralists cannot distinguish between what men *should* desire and what in fact they *do* desire.

Since moral science deals with human behavior, its province can be separated from that of other sciences which treat the same subject matter—such as psychology and sociology—only in terms of a different treatment of that subject matter. Moral science must be normative or prescriptive rather than descriptive. It must determine what men *should* seek, not what they *do* seek. The very existence of normative sciences, as well as their validity, would thus seem to depend on the establishment of a real, as opposed to a merely apparent, good.

This creates no special difficulty for moralists who think that man knows what is really good for him, both in general and in particular, by intuition or rational deduction, through the commandments of the divine law, or through the precepts of the law of reason. But for those who insist that the good is always somehow relative to desire and always involves pleasure, the distinction between the real and the apparent good raises an extremely difficult problem.

To say that an apparent good is not really good suggests, as we have seen, that what is called "good" may not be in itself desirable. That something which is really good may not in fact appear to be so, seems to imply that the word "good" can be significantly applied to something which is not actually desired—at least not consciously. How, then, is the good always relative to desire? The traditional answer to this question must appeal to the distinction between natural and conscious desire, which is discussed in the chapter on *DESIRE*. It is by reference to natural desire that the good is said to be in itself always desirable—even when the really good thing is not consciously desired.

The relation of good and evil to pleasure and pain can also be clarified by a basic distinction between the pleasure which is an object of de-

sire and pleasure conceived as the satisfaction of desire. This is discussed in the chapter on *PLEASURE AND PAIN*. If obtaining a desired good is satisfying, then there is certainly a sense in which the good and the pleasant (or the satisfying) are always associated; but it may also be true that pleasure is only one kind of good among various objects of desire and that certain pleasures which men desire appear to be, but are not really good.

THE FOREGOING considerations apply to the good in the sphere of human conduct. But the human good, the practicable good, the good for man, does not exhaust the meaning of the term *good*. The idea of the good is, for Plato, the measure of perfection in all things; it is "not only the author of knowledge to all things known, but of their being and essence, and yet the good is not essence, but far exceeds essence in dignity and power."

The absolute good is also, as in the *Divine Comedy*, the final cause or ultimate end of the motions of the universe. It is "the Alpha and Omega," Dante says, "of every scripture that Love reads to me . . . the Essence wherein is such supremacy that every good which is found outside of It is naught else than a beam of Its own radiance . . . the Love which moves the sun and the other stars."

So too, in Aristotle's cosmology, the circular motions of the celestial spheres, and through them all other cycles of natural change, are sustained eternally by the prime mover, which moves all things by the attraction of its perfect being. It therefore "moves without being moved," for it "produces motion through being loved."

Though desire and love enter into the conception of the good as a cosmic final cause, they are not *human* desire or love. Though the goodness which inheres in things according to the degree of their perfection may make them desirable, it is not dependent on their being consciously desired by men.

In Jewish and Christian theology, for example, the goodness of God is in no way measured by human desires, purposes, or pleasures; nor is the goodness of created things which, according to Genesis, God surveyed and found "very good." The order of creation, moreover,

involves a hierarchy of inequalities in being and goodness. Even when each thing is perfect in its kind, all things are not equally good, for according to the differences in their natures, diverse kinds are capable of greater or less perfection.

In the metaphysical conception of goodness, that which has more actuality either in existence or power has more perfection. God's infinite goodness is therefore said to follow from the fact that he is completely actual—infinite in being and power. Things "which have life," Augustine writes, "are ranked above those which have none . . . And among those that have life, the sentient are higher than those which have no sensation . . . and among the sentient, the intelligent above those that have no intelligence."

Augustine contrasts these gradations of perfection which are "according to the order of nature" with the "standards of value" which are "according to the utility each man finds in a thing." That which is less good in a metaphysical sense may be preferred on moral grounds as being better for man. "Who," he asks, "would not rather have bread in his house than mice, gold than fleas?" Is it not true that "more is often given for a horse than for a slave, for a jewel than for a maid"?

According to Augustine, as well as to Aquinas later, metaphysical goodness consists in "the value a thing has in itself in the scale of creation," while moral goodness depends upon the relation in which a thing stands to human need or desire, and according to the estimation placed upon it by human reason. It is in the moral, not the metaphysical sense that we speak of a good man, a good will, a good life, and a good society; or of all the things, such as health, wealth, pleasure, virtue, or knowledge, which it may be good for man to seek and possess. Only in the metaphysical sense can things be thought of as good entirely apart from man; only then can we find a hierarchy of perfections in the world which accords with a hierarchy of beings. Thus Spinoza declares that "the perfection of things is to be judged by their nature and power alone; nor are they more or less perfect because they delight or offend the human senses, or because they are beneficial or prejudicial to human nature."

THE METAPHYSICAL conception of goodness raises peculiarly difficult problems. Are there as many meanings of "good" as there are of "being"? When we say God is good, are we making a moral or a metaphysical judgement? Are we attributing perfection of being or goodness of will to God? If goodness is a property of being, then must not all evil become a privation of being? Conceiving evil in this way, Augustine points out that if things "be deprived of all good, they shall cease to be," so that there is "nothing whatsoever evil" in itself; and Aquinas maintains that "no being is said to be evil, considered as being, but only so far as it lacks being."

If to understand what the notion of goodness adds to the notion of being it is necessary to say that being has goodness in relation to appetite, the question inevitably arises, "Whose appetite?" Not man's certainly, for then the moral and the metaphysical good become identical. If God's, then not appetite in the form of desire, but in the form of love, for the divine perfection is usually thought to preclude desire.

Problems of this sort confront those who, conceiving the good both *apart from* and also *relative to* man, are obligated to connect the metaphysical and the moral meanings of good and to say whether they have a common thread. Some writers, however, limit their consideration to the strictly moral good, and deny, as do the Stoics, goodness or evil to anything but man's free acts of will.

We should, says Marcus Aurelius, "judge only those things which are in our power, to be good or bad." In this we are entirely free, for "things themselves have no natural power to form our judgments . . . If thou art pained by any external thing, it is not this thing which disturbs thee, but thy own judgment about it. And it is in thy power to wipe out this judgment now . . . Suppose that men kill thee, cut thee in pieces, curse thee. What then can these things do to prevent thy mind from remaining pure, wise, sober, just?"

Though Kant develops what he calls a "metaphysic of ethics," he does not seem to have a metaphysical as opposed to a moral conception of the good; unless in some analogous form it lies in his distinction between "value" and "dignity," according to which "whatever has

reference to the general inclinations and wants of mankind has a *market value*," whereas "whatever . . . is above all value, and therefore admits of no equivalent, has a dignity"—"not a merely relative worth, but an intrinsic worth."

But since Kant thinks that only men, or rational beings, can have intrinsic worth, he finds goodness only in the moral order. He agrees with the Stoics that good and evil occur only in the realm of freedom, not at all in the realm of existence or nature. "Good or evil," he writes, "always implies a reference to the *will*, as determined by the *law of reason*" which is the law of freedom. According to Kant, "nothing can possibly be conceived in the world, or even out of it, which can be called good without qualification, except a Good Will"; and in another place he says, "If anything is to be good or evil absolutely . . . it can only be the manner of acting, the maxim of the will." In this sense, the free will complying with or resisting the imperatives of duty is either the seat or the source of all the goodness or evil that there is. "Men may laugh," Kant says, "at the Stoic, who in the severest paroxysms of gout cried out: Pain, however thou tormentest me, I will never admit that thou art an evil: he was right . . . for pain did not in the least diminish the worth of his person, but only that of his condition."

IN THE SPHERE of moral conduct, and especially for those who make desire or pleasure rather than duty the principle, there seems to be a plurality of goods which require classification and order.

Some things, it would appear, are not desired for themselves, but for the sake of something else. They are good only as means to be used. Some things are desired for their own sake, and are good as ends, to be possessed or enjoyed. This division of goods into means and ends—the useful and the enjoyable or pleasant—permits a third type of good which is an end in one respect, and a means in another. Analysis of this sort leads to the concept of a *summum bonum*—that good which is not a means in any respect, but entirely an end, the supreme or highest good for which all else is sought.

The chief question with respect to the *summum bonum* is whether it is a good or the good—whether it is merely one type of good, more

desirable than any other, or the sum of all good things which, when possessed, leaves nothing to be desired. Aristotle and Mill seem to take the latter view in their conception of happiness as the *summum bonum*. "Human nature," Mill says, "is so constituted as to desire nothing which is not either a part of happiness or a means of happiness." Happiness, he insists, is "not an abstract idea, but a concrete whole" including all other goods within itself. It is the only good which is desired entirely for its own sake. Aristotle treats virtue and knowledge as intrinsic goods, but he also regards them as means to happiness. In Mill's terms, their goodness remains subject to the criterion of utility, from which happiness alone is exempt since it measures the utility of all other goods.

If the evaluation of all things by reference to their contribution to happiness as the ultimate good constitutes utilitarianism in ethics, then Aristotle no less than Mill is a utilitarian, even though Aristotle does not refer to the principle of utility, does not identify the good with pleasure, and conceives the virtues as intrinsically good, not merely as means. Kant would regard them as in fundamental agreement despite all their differences—or at least he would regard them as committing the same fundamental error.

To Kant any discussion of human conduct which involves the calculation of means to ends is pragmatic or utilitarian, even when the controlling end is the *summum bonum* or happiness. Kant makes a sharp distinction between what he calls "pragmatical rules" of conduct which consider what should be done by one who wishes to be happy, and what he regards as the strictly "moral or ethical law" which "has no other motive than the *worthiness of being happy*." Morality, he says in another place, "is not properly the doctrine of how we should *make* ourselves happy, but how we should become *worthy* of happiness"—through doing our duty.

Kant's criticism of Aristotle's ethics of happiness is therefore applicable to the utilitarianism of Mill; and Mill's rejoinder to Kant serves as a defense of Aristotle. This basic issue concerning the primacy of happiness or duty—of desire or law—is discussed in the chapters on DUTY and HAPPINESS, where it is suggested that

that in an ethics of duty, right and wrong supplant good and evil as the fundamental terms, and the *summum bonum* becomes a derivative notion rather than the first principle of morality.

At the other extreme are those who deny duty entirely, and with it any meaning to right and wrong as distinct from good and evil. A middle ground is held by those who employ right and wrong as subordinate terms in the analysis of good and evil, finding their special significance in the consideration of the good of others or the social good. To do right is to do good to others; to do wrong is to injure them. The question which Plato so insistently raises, whether it is better to do injustice or to suffer it, can also be stated in terms of good and evil, or right and wrong. Is it better to suffer evil or to do it? Is it better to be wronged by others or to wrong them? As justice for Aristotle is that one among the virtues which concerns the good of others and the common good, and as it is the one virtue which is thought to involve duty or obligation, so the criteria of right and wrong measure the goodness or evil of human acts by reference to law and society.

THE DIVISION of goods into means and ends is not the only distinction made by moralists who recognize the plurality and inequality of goods.

Goods have been divided into the limited and the unlimited with respect to quantity; the pure and the mixed with respect to quality; sensible and intelligible goods or particular goods and the good in general; external goods, goods of the body, and goods of the soul; the pleasant, the useful, and the virtuous. More specific enumerations of the variety of goods list wealth, health, strength, beauty, longevity, pleasure, honor (or fame), virtue, knowledge, friendship.

All of the foregoing classifications can be combined with one another, but there is one distinction which stands by itself, although it affects all the others. That is the distinction between the individual and the common good, or between private and public good, the good for this one man and the good of all others and of the whole community. In the language of modern utilitarianism, it is the distinction between individual happiness and what Bentham called "the greatest good for the greatest number."

The phrase "common good" has several meanings in the tradition of the great books. One sense, which some think is the least significant, refers to that which can be shared or used by many, as, for example, land held in common and worked by a number of persons or families. Thus we speak of the "commons" of a town or village. This meaning applies particularly to economic goods which may either belong to the community as a whole or be divided into parcels of private property.

Another sense of common good is that in which the welfare of a community is a common good participated in by its members. The welfare of the family or the state is a good which belongs to a multitude organized for some common purpose. If the individual members of the group derive some benefit from their association with one another, then the prosperity of the community is not only a common good viewed collectively, but also a common good viewed distributively, for it is the good of each member of the group as well as of the whole.

With this in mind, perhaps, Mill speaks of "an indissoluble association between [the individual's] happiness and the practice of such mode of conduct, negative and positive, as regard for the universal happiness prescribes; so that not only he may be unable to conceive the possibility of happiness to himself, consistently with conduct opposed to the general good, but also that a direct impulse to promote the general good may be in every individual one of the habitual modes of action." If this statement by Mill is used to interpret Bentham's phrase—"the greatest good for the greatest number"—then the greatest number cannot be taken to mean a majority, for the good of nothing less than the whole collectively or of all distributively can be taken as the common or general good.

Still another conception of the common good is possible. A good may be common in the sense in which a specific nature is common to the members of the species—not as organized socially in any way, but simply as so many *like* individuals. If all men seek happiness, for example, then happiness is a common good, even though each individual seeks his own happiness. In a deeper sense it is a common good if the happiness each seeks is the same for all men

because they are all of the same nature; but, most strictly, it is a common good if the happiness of each individual cannot be separated from the happiness of all.

Aquinas seems to be using this meaning of *common good* when, in defining law as a rule of conduct "directed to the common good," he refers not merely to the good of the community or body politic, but beyond that to "the last end of human life," which is "happiness or beatitude." Law, he says, "must needs concern itself properly with the order directed to universal happiness." Mill also seems to conceive happiness as a common good in this sense. "What the assailants of utilitarianism seldom have the justice to acknowledge," he writes, is "that the happiness which forms the utilitarian standard of what is right in conduct, is not the agent's own happiness, but that of all concerned."

The several meanings of the common good create a fundamental issue. Some writers use it in one sense only, rejecting the others. Some not only use the term in all its meanings, but also develop a hierarchy of common goods. They regard universal happiness, for example, as a common good of a higher order than the welfare of the political community. Yet in every order they insist upon the primacy of the common over the individual good. In the political order, for example, they think the welfare of the community takes precedence over individual happiness. They would regard Adam Smith's statement of the way in which individuals accidentally serve the common good while seeking their private interests, as a perversion of the relationship. To say that an individual considering only his own gain is "led

by an invisible hand to promote an end which was no part of his intention" (*i.e.*, the general prosperity of society) does not excuse the individual's failure to aim at the common good.

The several meanings of the common good also complicate the statement of the issue between those who seem to say that the welfare of the community always takes precedence over individual well-being or happiness—that the good of the whole is always greater than the good of its parts—and those who seem to say that the state is made for man, not man for the state, or that the prosperity of the society in which men live is good primarily because it enables each of them to live well. This issue, which runs through all the great books of political theory from Plato and Aristotle to Hegel and Mill, is discussed in the chapters on CITIZEN and STATE.

The opposition between collectivism and individualism in economics and politics does not exhaust the issue which, stated in its broadest moral terms, is a conflict between self-interest and altruism. The primary problem to consider here is whether the issue is itself genuine, or only an opposition between false extremes which needlessly exclude the half-truth that each contains.

The collective aspect of the common good may not need to be emphasized at the expense of its distributive aspect. The good of each man and the good of mankind may be inseparable. It may be the same good which, in different respects, is individual and common. It may be that no good can be supreme which is not both immanent and transcendent—at once the highest perfection of the individual and a good greater than his whole being and his life.

OUTLINE OF TOPICS

1. The general theory of good and evil

1a. The idea of the good: the notion of finality

1b. Goodness in proportion to being: the grades of perfection and the goodness of order

1c. The good, the true, and the beautiful

1d. The origin, nature, and existence of evil

PAGE

615

616

617

	PAGE
2. The goodness or perfection of God: the plenitude of the divine being	618
2a. God's goodness as diffusive, causing the goodness of things: God's love	619
2b. The divine goodness and the problem of evil	
3. The moral theory of the good: the distinction between the moral and the metaphysical good	620
3a. Human nature and the determination of the good for man: the real and the apparent good; particular goods and the good in general	621
3b. Goodness in the order of freedom and will	622
(1) The prescriptions of duty	
(2) The good will: its conditions and consequences	623
3c. The good and desire: goodness causing movements of desire and desire causing estimations of goodness	
3d. Pleasure as <i>the</i> good, <i>a</i> good, or <i>feeling</i> good	624
3e. Right and wrong: the social incidence of the good; doing or suffering good and evil	
3f. The sources of evil in human life	625
4. Divisions of the human good	626
4a. Sensible and intelligible goods	
4b. Useful and enjoyable goods: good for an end and good in itself	
4c. Goods of the body and goods of the soul	627
4d. Intrinsic and external goods: intrinsic worth and extrinsic value	
4e. Individual and common goods	628
5. The order of human goods	
5a. The supreme good or <i>summum bonum</i> : its existence and nature	
5b. The judgment of diverse types of good: their subordination to one another	629
5c. The dialectic of means and ends: mere means and ultimate ends	630
5d. The supremacy of the individual or the common good: the relation of the good of the individual person to the good of other persons and to the good of the state	631
6. Knowledge and the good	632
6a. Knowledge, wisdom, and virtue: the relation of being good and knowing what is good	
6b. The need for experience of evil	633
6c. The goodness of knowledge or wisdom: the use of knowledge	
6d. The possibility of moral knowledge: the subjectivity or conventionality of judgments of good and evil	634

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265–283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a–119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b–164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265–283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation “esp” calls the reader's attention to one or more especially relevant parts of a whole reference; “passim” signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The general theory of good and evil

OLD TESTAMENT: *Isaiah*, 45:7—(D) *Isaiah*, 45:7 / *Lamentations*, 3:38

Chapter 31: GOVERNMENT

INTRODUCTION

THE usual connotation of "government" is political. The word is often used interchangeably with "state." But there is government in a university, in an economic corporation, in the church, in any organization of men associated for a common purpose. The theologian speaks of the divine government of the universe, and the moralist speaks of reason as the ruling power in the soul which governs the appetites or passions.

In all these contexts, the notion of government involves the fundamental relations of ruling and being ruled, of command and obedience. Though the character of these relationships varies somewhat with the terms related, there is enough common meaning throughout to permit a general consideration of the nature of government. But that is not the way in which government is discussed in the great books. For the most part, government is considered in one or another of its special settings—as it functions in the family or the state, in the soul or the universe. The common thread of meaning is noted only indirectly, by the way in which comparisons are made or analogies are drawn between the various modes of government.

In view of this, we have found it convenient to restrict this chapter to government in the political sense, treating domestic and ecclesiastical government under *FAMILY* and *RELIGION*, economic government under *WEALTH*, divine government in the chapters on *GOD* and *WORLD*, and government in the soul in the several chapters which consider the relation of reason to the passions, such as *DESIRE* and *EMOTION*.

Government and *state* are often used as if they were interchangeable terms. Some writers differentiate their meanings by using "state" to signify the political community itself, and

"government" to refer to the way in which it is politically organized. Yet the two concepts tend to fuse in traditional political theory. The kinds of states, for example, are usually named according to their forms of government. The great books speak of monarchical and republican states, as we today speak of the fascist or the democratic state.

Nevertheless, we recognize the distinction between a state and its government when we observe that the state can maintain its historic identity while it undergoes fundamental changes in its form of government. The state is not dissolved by a revolution which replaces a monarchy by a republic, or conversely. There is a sense in which Rome is the same state under the Tarquins, under the Republic, and under the Caesars. In contrast, some rebellions, such as the War of Secession in American history, threaten to dissolve the state itself.

Despite the fact that government involves a relation between rulers and ruled, the word is often used to designate one term in that relationship, namely, the rulers. When the citizens of a republic speak of "the government," they usually refer to the officialdom—not the body of citizens as a whole, but only those who for a time hold public office. But government cannot consist of governors alone, any more than education can consist of teachers alone. The different forms of government can be distinguished as readily by looking to the condition of the ruled as to the powers of the rulers. Furthermore, the same individuals may both "rule and be ruled by turns," as Aristotle observes of constitutional government.

Though the notion of government includes both rulers and ruled, the word usually appears in political literature with the more restricted meaning. When writers refer to the branches or departments of government, or when they

speak of the sovereignty of a government, they direct attention to the ruling power, and to the division of that power into related parts.

THE GREAT BOOKS OF political theory ask a number of basic questions about government. What is the origin of government, its nature and necessity? What ends does government serve and how do these ends define its scope and limits? What is the distinction between good and bad government, between legitimate and illegitimate, or just and unjust, government? What are the forms of government, of good government, of bad government? What are the various departments or branches of government, and how should they function with respect to one another?

These questions are related. The origin, nature, and necessity of government have a bearing on its ends and limits. These same considerations enter into the discussion of the legitimacy and justice of governments. They also have a bearing on the classification of the forms of government, and on the evaluation of diverse forms. The way in which the several branches of government should be related is affected by the way in which the various forms of government differ.

These questions are not always approached in the same order. Some of the great political theorists—for example, Hobbes, Locke, and Rousseau—find their fundamental principles in the consideration of the origin of government. They start with such questions as, What makes it legitimate for one man to govern another? Is the exercise of political power both justified and limited by the end it serves? In answering these questions, they imply or make a distinction between good and bad government and indicate the abuses or corruptions to which government is subject. Though they enumerate the various forms of government in a manner which reflects the traditional classifications, they do not seem to regard that problem as of central importance.

Other eminent political thinkers make the classification and comparison of diverse forms the central problem in the theory of government. Plato and Aristotle, Montesquieu and Mill, are primarily concerned with the criteria by which the justice or goodness of a govern-

ment shall be judged. They compare various forms of government as more or less desirable, nearer to the ideal or nearer to the opposite extreme of corruption. In the course of these considerations they answer questions about the necessity, the legitimacy, and the ends of government in general.

THERE SEEMS TO BE considerable agreement on one point, namely, that government is necessary for the life of the state. It is generally held by the authors of the great books that no community can dispense with government, for without government men cannot live together in peace. None is an anarchist, like Thoreau or Kropotkin, although Kropotkin claims that *War and Peace* and even Mill's *Essay on Liberty* contain "anarchist ideas." Marx and Engels may be the other possible exception to the rule.

If Marx and Engels take the opposite view, they do so simply on the ground that with the advent of a classless society after the communist revolution, the class war will come to an end and there will no longer be any need for government. The state can quietly wither away. But, according to Aquinas, even if society were free from all injustice and iniquity, even if men lived together in a state of innocence and with the moral perfection they would possess if Adam had not sinned, even then government would be necessary. "A social life," he thinks, "cannot exist among a number of people unless government is set up to look after the common good."

The great books do not agree about the naturalness of the state. They do not agree about the way in which government originates historically or about the functions it should and should not perform. They do not all reflect in the same way on the good and evil in government. Nor do they all give the same reasons for the necessity of government. In consequence they set different limits to the scope of government and assign it different functions, which range from the merely negative function of preventing violence to the duty to provide positively for human welfare in a variety of ways.

On all these things they differ, but with the exceptions noted they do concur in thinking that anarchy—the total absence of government—is unsuitable to the nature of man. Man be-

ing what he is, "any form of government," in Darwin's opinion, "is better than none." Some, like Hobbes and Kant, identify anarchy with the state of nature which is for them a state of war. Some, like Locke, think that the state of nature is not a state of war, yet find great advantages to living in civil society precisely because government remedies the inconveniences and ills which anarchy breeds. But though they often write as if men could choose between living in a state of nature or in a civil society, they do not think man has any option with respect to government if he wishes the benefits of the civilized life. They cannot conceive civil society as existing for a moment without government.

THE GENERAL AGREEMENT about the necessity of government tends to include an agreement about the two basic elements of government—authority and power. No government at all is possible, not even the most attenuated, unless men obey its directions or regulations. But one man may obey another either *voluntarily* or *involuntarily*—either because he recognizes the right vested in that other to give him commands or because he fears the consequences which he may suffer if he disobeys.

These two modes of obedience correspond to the authority and power of government. Authority elicits voluntary compliance. Power either actually coerces or, by threatening coercion, compels involuntary obedience. Authority and power are the right and might of government. Either can exist and may operate apart from the other; but, as Rousseau points out, when right is lacking, government is illegitimate; and as Hamilton points out, when might is lacking, it is ineffective.

In a famous passage, the Federalists explain that rule by authority alone might work in a society of angels. But since men are men, not angels, their obedience must be assured by the threat of force. In any society in which some men are good, some bad, and all may be either at one time or another, force is the only expedient to get the unwilling to do what they should do for the common good. Even when the institutions of government have their authority from the consent of the governed, they cannot function effectively without the

use of power or force. For this reason Hamilton dismisses "the idea of governing at all times by the simple force of law" as having "no place but in the reveries of those political doctors whose sagacity disdains the admonitions of experimental instruction."

If authority without force is ineffective for the purposes of government, might without right is tyrannical. "Wherever law ends, tyranny begins," Locke writes, "and whosoever in authority exceeds the power given him by the law, and makes use of the force he has under his command to compass that upon the subject which the law allows not, ceases in that to be a magistrate." The use of unauthorized force may take the form of either usurpation or tyranny. If it is "the exercise of power which another hath a right to," Locke declares it is usurpation; if it is "the exercise of power beyond right, which nobody can have a right to," it is tyranny.

The distinction between legitimate rule and all dominations by force rests not on the use of power, but on whether the power which must be employed is or is not legally authorized.

THE NOTION OF SOVEREIGNTY involves considerations of authority and power. The word itself is mediaeval and feudal in origin. It signifies the supremacy of an overlord who owes allegiance to no one and to whom fealty is due from all who hold fiefdoms under him. Since the supremacy of the sovereign lord is clothed with legal rights, according to the customs of feudal tenure, sovereignty seems to imply the union of power with authority, not the use of naked force.

The political philosophers of antiquity do not use the term *sovereignty*. But their discussion of the distribution of political power is certainly concerned with the possession of authority as well as the control of force. Aristotle's question, for example, about "what is to be the supreme power in the state—the multitude? or the wealthy? or the good? or the one best man?" deals with the same problem which modern writers express by asking where sovereignty resides. As Aristotle sees the conflict between the oligarchical and the democratic constitutions, the issue concerns the legal definition of the ruling class: whether the constitu-

tion puts all the political power in the hands of the rich or in the hands of the freeborn, rich and poor alike. It does not seem to be too violent an interpretation for modern translators to use the word "sovereignty" here, for sovereignty can be said to belong to whatever person or class holds the supreme power by law.

Within this meaning of sovereignty the basic difference between absolute and limited government, or between the despotic and the constitutional regime, leads to a distinction between the sovereign man and the sovereign office.

The ruler who holds sovereignty in his person is an absolute sovereign if his power and authority are in no way limited by positive law. According to some political philosophers, sovereignty must be absolute. In the opinion of Hobbes, for example, the notion of a limited sovereignty seems to be as self-contradictory as that of a supremacy which is not supreme.

After discussing the absolute rights which constitute sovereignty, Hobbes goes on to say that "this great authority being indivisible . . . there is little ground for the opinion of them that say of sovereign kings, though they be *singulis majores*, of greater power than every one of their subjects, yet they be *universis minores*, of less power than them all together. For if by *all together* they mean not the collective body as one person, then *all together* and *every one* signify the same, and the speech is absurd. But if by *all together* they understand them as one person (which person the sovereign bears), then the power of all together is the same as the sovereign's power, and so again the speech is absurd."

It makes no difference, Hobbes argues, whether the sovereignty is held by one man or by an assembly. In either case "the sovereign of a commonwealth . . . is not subject to the civil laws. For having the power to make and repeal laws, he may when he pleases, free himself from that subjection by repealing those laws that trouble him." The sovereign therefore has absolute power, which consists in the absolute right or liberty to do as he pleases, for "he that is bound to himself only is not bound" at all.

Aquinas seems to be taking the same view when he admits that "the sovereign is . . .

exempt from the law as to its coercive power, since, properly speaking, no man is coerced by himself, and law has no coercive power save from the authority of the sovereign." But Aquinas differs from Hobbes in thinking that the authority, if not the power, of the prince is limited by the constitutional character of the kingly office. In the mediaeval conception of monarchy, the king is bound not to himself alone, as Hobbes insists, but to his subjects. Their oath of allegiance to him is reciprocated by his coronation oath, in which he assumes the obligation to uphold the customs of the realm.

WHERE AQUINAS CONCEIVES the sovereign prince as one element—the other being established law—in a government which is therefore both absolute and constitutional, Hobbes conceives the sovereign as identical with a government which is wholly absolute. The distinction here implied—between a mixed regime and one that is purely absolute—is more fully discussed in the chapters on CONSTITUTION and MONARCHY. In contrast to both, a republic, or purely constitutional government, substitutes the sovereign office for the sovereign man. It denies the possession of sovereignty to men *except* in their capacity as office-holders.

According to the republican notions of Rousseau, not even government itself has sovereignty except as representing the political community as a whole, which is the sovereign. Sovereignty, he writes, is vested in the government "simply and solely as a commission, an employment in which the rulers, mere officials of the Sovereign, exercise in their own name the power of which it makes them depositaries." Since this power is not theirs except by delegation, it can be limited, modified, or recovered at pleasure, "for the alienation of such a right is incompatible with the nature of the social body, and contrary to the end of association."

The unity of sovereignty is not impaired by the fact that a number of men may share in the exercise of sovereign power, any more than the unity of government is destroyed by its division into separate departments or branches, such as the legislative, executive, and judicial. Since in a republic the government (in all its branches or offices) derives its power and

authority from the constitution (or what Rousseau calls "the fundamental law"), and since it is the people as a whole, not the officials of government, who have the constitutive power, the people are in a sense supreme or sovereign.

Popular sovereignty may mean that the people as a whole govern themselves without the services of magistrates of any sort; but this would be possible only in a very small community. It is questionable whether a people has ever exercised sovereignty in this way in any state of historic importance. Popular sovereignty more usually means what is implied by Aquinas when he conceives the magistrate or ruler as merely the viceregent of the people. "To order anything to the common good," he writes, "belongs either to the whole people, or to someone who is the viceregent of the whole people. Hence the making of a law belongs either to the whole people or to a public personage who has the care of the whole people." Similarly, the exercise of coercive force "is vested in the whole people or in some public personage, to whom it belongs to inflict penalties."

The notion of a *public personage*, as Aquinas uses it in these passages, is clearly that of a surrogate for or representative of the whole people. The people as a whole have, in the first instance, the authority and power to perform all the functions of government. Only if for convenience or some other reason they constitute one or more public personages to act in their stead, do individual men exercise sovereignty, and then only as representatives.

Locke's fundamental principle—that "men being . . . by nature all free, equal, and independent, no one can be put out of this estate and subjected to the political power of another without his own consent"—is another expression of the idea of popular sovereignty. It reappears in the Declaration of Independence in the statement that since governments are instituted by men to secure their fundamental rights, they must derive "their just powers from the consent of the governed."

Hegel objects to the sense "in which men have recently begun to speak of the 'sovereignty of the people'" as "something opposed to the sovereignty existent in the monarch. So op-

posed to the sovereignty of the monarch," he writes, "the sovereignty of the people is one of the confused notions based on the wild idea of the 'people.'" If the sovereignty of the people means nothing more than the sovereignty of the whole state, then, he says, the sovereignty which "is there as the personality of the whole . . . is there, in the real existence adequate to its concept, as the person of the monarch."

But republican writers would reply that the sense in which they speak of the sovereignty of the people cannot be opposed to the sovereignty of government, so long as that government is constitutional, not absolute. When the sovereignty of the people is conceived as the source or basis, not as the actual exercise, of the legitimate powers of government, there is no conflict between these two locations of sovereignty in the state. Yet the supremacy of the government always remains limited by the fact that all its powers are delegated and can be withdrawn or changed at the people's will.

THE QUESTION OF absolute or limited sovereignty and the connected question of unified or divided sovereignty have a different meaning in the case of the relation of governments to one another.

The theory of federal government, discussed in *The Federalist* and in Mill's *Representative Government*, contemplates a division of sovereignty, not as between the people and their government, but as between two distinct governments, to each of which the people grant certain powers. Distinguishing between the government of a national state and the government of a federal union, Madison writes: "Among a people consolidated into one nation . . . supremacy is completely vested in the national legislature. Among communities united for particular purposes, it is vested partly in the general and partly in the municipal legislatures. In the former case, all local authorities are subordinate to the supreme; and may be controlled, directed, or abolished by it at pleasure. In the latter, the local or municipal authorities form distinct and independent portions of the supremacy, no more subject, within their respective spheres, to the general authority than the general authority is subject to them within its own sphere." The federal or general and the

state or local governments draw on the same reservoir of popular sovereignty, but the sovereignty which each derives from that source is limited by the definition of matters reserved to the jurisdiction of the other.

The fundamental difference between the condition of states in a federation and the condition of colonial dependencies or subject peoples is that imperial government, unlike federal government, claims an unlimited sovereignty. The issues of imperialism which arise from the exercise of such power are discussed in the chapters on TYRANNY and SLAVERY.

The one remaining situation is that of independent governments, the governments of separate states associated with one another only by treaties or alliances, or at most in the kind of loose hegemony or league represented by the Greek confederacies or the American *Articles of Confederation*. In this situation, the word "sovereignty" applied to independent governments signifies supremacy, not in the sense of their having the authority and power to command, but in the opposite sense of *not being subject to any political superior*.

This radical difference in meaning is explicitly formulated in Hegel's distinction between internal and external sovereignty.

After stating the conditions of the sovereignty of the state in relation to its own people, Hegel says, "This is the sovereignty of the state at home. Sovereignty has another side, *i.e.*, sovereignty *vis-à-vis* foreign states." The state's individuality resides in its awareness of its own existence "as a unit in sharp distinction from others"; and in this individuality Hegel finds the state's autonomy, which he thinks is "the most fundamental freedom which a people possesses as well as its highest dignity."

But from the fact that "every state is sovereign and autonomous against its neighbors," it also follows, according to Hegel, that such sovereigns "are in a state of nature in relation to each other." It is this state of nature which Hobbes had earlier described as a state of war. Precisely because independent states have absolute sovereignty in relation to one another, "they live in the condition of perpetual war, and upon the confines of battle, with their frontiers armed, and cannons planted against their neighbors round about."

In their relation to one another they are, writes Kant, like "lawless savages." Following Rousseau, he thinks it is fitting that the state "viewed in relation to other peoples" should be called "a power." Unlike sovereign governments which unite authority with power in their domestic jurisdiction, sovereign states in their external relations can exert force alone upon each other. When their interests conflict, each yields only to superior force or to the threat of it. A fuller discussion of these matters will be found in the chapters on LAW, STATE, and WAR AND PEACE.

AS ALREADY INDICATED in several places, the materials covered in this chapter necessarily demand a study of many related chapters dealing with political topics. This is peculiarly true of the problems concerning the forms of government. Separate chapters are devoted to each of the traditionally recognized forms, *viz.*, ARISTOCRACY, DEMOCRACY, MONARCHY, OLIGARCHY, TYRANNY. Each of these chapters defines a particular form, distinguishes it from others, and compares their merits. In addition, the chapter on CONSTITUTION deals with what is perhaps the most fundamental of all distinctions in forms of government, that between a republic and a despotism, or between government by laws and government by men.

Here, then, it is necessary only to treat generally of the issues raised by the classification and comparison of diverse forms of government. They can be summarized in the following questions.

What are the criteria or marks of good government? Is the goodness of government determined by the end it serves, by the way in which it is instituted, by its efficiency in promoting whatever end it serves? Are such criteria of good government as justice, legitimacy, and efficiency, independent or interchangeable?

What is the nature of bad government? Can a distinction be made between the abuses or weakness to which good government is subject in actual operation, and government which is essentially bad because perverse or corrupt in principle as well as practice?

Are there several forms of good government? Of bad government? How are they differentiated from one another? Are all good forms

equally good, all bad forms equally bad? If not, what is the principle in terms of which some order of desirability or undesirability is established? For example, is one good form of government better than another, one bad form worse than another, in terms of degrees of justice and injustice, or in terms of efficiency and inefficiency? To put this question in another way, is one form of good government better than another because it achieves a better result or merely because it achieves the same result more completely?

If there are several distinct forms of good government, are there one or more ways in which these can be combined to effect a composite or mixed form? If a mixed form is comparable with the pure forms it unites, is it superior to all, to some, to none of them? On what grounds? In what circumstances?

While proposing what they consider to be the ideal form of government, some political philosophers admit that the ideal may not be realizable under existing circumstances or with men as they are. Plato, for example, recognizes that the state he outlines in the *Republic* may not be practicable; and in the *Laws* he proposes institutions of government which represent for him something less than the ideal but which may be more achievable. The Athenian Stranger says of the state described in the *Republic* that, "whether it is possible or not, no man, acting upon any other principle, will ever constitute a state which will be truer or better or more exalted in virtue." The state which he is discussing in the *Laws* "takes the second place." He refers to "a third best" which, far from being even the practicable ideal, may be merely the best form of government which now actually exists.

Aristotle also sets down the various ways in which forms of government can be judged and compared. We may consider, he writes, "of what sort a government must be to be most in accordance with our aspirations, if there were no external impediment," but we must also consider "what kind of government is adapted to particular states." In addition, Aristotle thinks it is necessary "to know the form of government which is best suited to states in general" as well as "to say how a state may be constituted under any given conditions."

Most important of all, it is necessary to know "not only what form of government is best, but also what is possible." Though "political writers have excellent ideas," Aristotle thinks they "are often impractical." Since "the best is often unattainable," the true legislator "ought to be acquainted not only with what is best in the abstract, but also with what is best relative to circumstances."

Both Montesquieu and Mill later apply this basic distinction between the best form of government considered absolutely or in the abstract, and the best form relative to particular historic circumstances. Among these are a people's economic condition, level of culture, political experience, geography, climate, and racial characteristics. Montesquieu, for example, thinks that government by law, absolutely considered, is better than despotic government, yet he also holds that despotic government is better for certain peoples. Mill thinks that the institutions of a representative democracy represent the ideal form of government, but he acknowledges that absolute monarchy may be better for a rude or uncivilized people who have not yet advanced far from barbarism.

The great question here is whether the circumstances themselves can be improved so that a people may become fit or ready for a better form of government, and ultimately for the best that is attainable, that is, the form relative to the best possible conditions. Since Montesquieu emphasizes what he considers to be fixed racial characteristics, such as the servility of the Asiatics, whereas Mill stresses conditions which are remediable by education, economic progress, and social reforms, these two writers tend to give opposite answers. The issue is more fully discussed in the chapters on DEMOCRACY, MONARCHY, and PROGRESS.

Still other questions remain and should be mentioned here. Are the ideal state and the ideal form of government inseparable, or can one be conceived apart from the other? How shall the ideal government be conceived—in terms of the best that is practicably attainable, given man as he is or can be; or in terms of a perfection which exceeds human attainment and which men can imitate only remotely or imperfectly, if at all? Does divine government, for example, set a model which human govern-

ment should aim to approximate? Is that human government ideal which is most like the divine; or, on the contrary, is the perfection of human government measured by standards drawn from the nature of man and the difficulties involved in the rule of men over men?

THE TRADITIONAL enumeration of the functions of government is threefold: the legislative, the judicial, and the executive. Locke adds what he calls "the federative power," the power of making treaties or alliances, and in general of conducting foreign affairs. It may be questioned whether this function is strictly coordinate with the other three, since foreign, like domestic, affairs may fall within the province of the executive or the legislature, or both, as in the case of the Constitution of the United States.

In our own day, the multiplication of administrative agencies and the development of planning boards have been thought to add a new dimension to the activities of government, but again it may be questioned whether these are not merely supplemental to the functions of making law, applying law to particular cases, and regulating by administrative decree those matters which fall outside the domain of enforceable law. The executive branch of government seems the most difficult to define, because it involves both law enforcement and the administration of matters not covered by legislative enactment or judicial decision.

If the threefold division of the functions of government is exhaustive, the question remains how these distinct activities shall be related to one another, and by whom they shall be performed. In an absolute monarchy, in

which the king *is* the government, all powers are in the hands of one man. Though he may delegate his powers to others, they act only as his deputies or agents, not as independent officials. This does not obliterate the theoretical distinction between legislation, adjudication, and execution, but in this situation there can be no practical separation of the three powers, certainly no legal system of checks and balances.

It is the separation of powers, according to Montesquieu, that is the basis of political liberty. "Power should be a check to power," he writes. In a system of separated powers, "the legislative body being composed of two parts, they check one another by the mutual privilege of rejecting. They are both restrained by the executive power, as the executive is by the legislative."

Whether or not Montesquieu is right in attributing this aspect of constitutionalism to the limited monarchy of England in his own day, his argument can be examined apart from history, for it raises the general question whether government by law can be preserved from degenerating into despotic government except by the separation of powers.

For the American Federalists, the system of checks and balances, written into the Constitution, so contrives "the interior structure of the government that its several constituent parts may, by their mutual relations, be the means of keeping each other in their proper places." This they consider the prime advantage to be gained from Montesquieu's principle of the separation of powers. The principle itself they hold to be "the sacred maxim of free government."

OUTLINE OF TOPICS

	PAGE
1. The general theory of government	646
1a. The origin and necessity of government: the issue concerning anarchy	
1b. Comparison of political or civil government with ecclesiastical government and with paternal or despotic rule	647
1c. The ends and limits of government: the criteria of legitimacy and justice	648
1d. The elements of government: authority and power, or coercive force; the distinction between <i>de jure</i> and <i>de facto</i> government	
1e. The attributes of good government	649
1f. The abuses and corruptions to which government is subject	650

1g. The sovereignty of government: the unity and disposition of sovereignty	650
(1) The sovereign person: sovereignty vested in the individual ruler	
(2) The sovereign office: the partition of sovereignty among the offices created by a constitution	651
(3) The sovereign people: the community as the source of governmental sovereignty	
1h. Self-government: expressions of the popular will; elections; voting	652
2. The forms of government: their evaluation and order	
2a. The distinction and comparison of good and bad forms of government	
2b. The combination of different forms of government: the mixed constitution, the mixed regime	653
2c. The absolute and relative evaluation of forms of government: by reference to the nature of man or to historic circumstances	
2d. The influence of different forms of government on the formation of human character	654
2e. The ideal form of government: the distinction between practicable and utopian ideals	
3. The powers, branches, or departments of government: enumerations, definitions, and orderings of these several powers	
3a. The separation and coordination of the several powers: usurpations and infringements by one branch of government upon another	655
3b. The relation of the civil to the military power	
3c. The legislative department of government: the making of law	656
(1) The powers and duties of the legislature	
(2) Legislative institutions and procedures	
3d. The judicial department of government: the application of law	657
(1) The powers and duties of the judiciary	
(2) Judicial institutions and procedures	
3e. The executive department of government: the enforcement of law; administrative decrees	658
(1) The powers and duties of the executive	
(2) Administrative institutions and procedures	
4. The support and the expenditures of government: taxation and budget	659
5. The relation of governments to one another: sovereign princes or states as in a condition of anarchy	
5a. Foreign policy: the making of treaties; the conduct of war and peace	660
5b. The government of dependencies: colonial government; the government of conquered peoples	
5c. The relation of local to national government: the centralization and decentralization of governmental functions	661
5d. Confederation and federal union: the division of jurisdiction between state and federal governments	
6. Historical developments in government: revolution and progress	662

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 32: HABIT

INTRODUCTION

THE familiar word "habit" has a tremendous range of meaning. Some of its meanings in technical discourse are so divergent from one another—as well as from the popular understanding of the term—that it is difficult to find a common thread of derivation whereby to pass from one meaning to another.

We can eliminate at once the use of the word to designate apparel, as when we speak of a "riding habit." Yet even this sense contains a root of meaning which cannot be dismissed. Augustine points out that "the term 'habit' is derived from the verb 'to have'" and Aristotle, considering the meanings of 'to have,' includes the sense in which a man may be said "to have a coat or tunic" along with the sense in which a man may be said to have a habit—"a piece of knowledge or a virtue." Just as clothes are something a person *has* or *possesses* in a manner more or less fitting to the body, so habits in the psychological sense are qualities which a person has or possesses, and they too can be judged for their fitness.

This understanding of habit is conveyed in the ancient remark which has become a common expression—that "habit is second nature." Habit is not *original* nature, but something added thereto as clothes are added to the body. But unlike clothes, which are added externally and merely by contact, habits as second nature are nature itself transformed or developed. In the words of an ancient poet, whom Aristotle quotes with approval, "habit's but long practice, and this becomes men's nature in the end."

Not all, as we shall see, would grant that practice is essential to habit. Nevertheless the word "practice" suggests one notion that is common to all theories of acquired habit, namely, that habit is a *retained effect*—the result of something done or experienced. Within this common understanding, there are opposite views. Accord-

ing to one view, the acquisition of habits depends on activity. According to another, habits are modifications, passively, not actively, acquired.

The word "habit" is also used in a sense diametrically opposite to the meanings so far considered. It is the sense in which Aristotle, in the *History of Animals*, discusses the habits of animals, and differentiates species according to the differences in their habits. Here the word "habit" is used to signify not an acquired pattern of behavior, but an innate predisposition to act or react in a certain way. The difference between acquired habits and "the habits to which there is an innate tendency," James tells us, is marked by the fact that the latter generally "are called instincts."

The opposition between these two meanings of "habit" is clear. On the one hand, habits represent what, in the case of living things at least, is added by nurture to nature—the results of experience, training, or activity. On the other hand, habits which are identical with instincts belong to original nature itself—part of the native endowment of the animal. Is there any common thread of meaning in the notions of acquired and innate habit which may explain the use of the word in such opposite senses?

The familiar statement that a person does what he is in the habit of doing indicates that a habit is a tendency to a particular sort of behavior. Knowledge of a person's habits enables us to predict what he is likely to do in any situation which elicits habitual conduct on his part. So, too, an animal's behavior in a particular situation may be predicted from a knowledge of its instincts. Instinct and habit—or innate and acquired habits—seem to have this common character; that they are tendencies to behavior of a specific or determinate sort. They are definitely not random behavior. In the one case, the

tendency is preformed, a part of the inherited nature of the organism. In the other, the tendency is somehow a product of experience and learning. In neither case does "habit" refer to mere capacity for action, unformed and indeterminate, nor does it refer to the action, but rather to the tendency to act.

THE MODIFIABILITY OF instincts by experience indicates another and more dynamic connection between innate and acquired habits. William James conceives innately determined behavior as if it were a plastic material out of which new patterns of conduct can be formed. The process of animal learning he thinks can be generally described as the replacement of instincts by habits. "Most instincts," he writes, "are implanted for the sake of giving rise to habits, and this purpose once accomplished, the instincts themselves, as such, have no *raison d'être* in the psychical economy, and consequently fade away."

Some years before the Russian physiologists Bechterev and Pavlov experimentally studied the conditioning of reflexes, James described animal learning in terms of the substitution of new for old responses to stimuli which had previously called forth an instinctive reaction, or in terms of the attachment of instinctive responses to new stimuli. "The actions we call instinctive," James writes, "all conform to the general reflex type" and "are called forth by determinate sensory stimuli." For example, a predatory animal, instinctively responsive to various perceptible signs of the whereabouts of its prey, may learn to hunt for its food in a particular locality, at a particular time, and in a particular way. Or, to take the example James gives, "if a child, in his first attempts to pat a dog, gets snapped at or bitten, so that the impulse of fear is strongly aroused, it may be that for years to come no dog will excite in him the impulse to fondle again." Similarly, an animal which has no instinctive fear of man may acquire a habitual tendency to flee at man's approach, as the result of experiences in which the appearance of man is associated with instinctively recognized signs of danger.

In the classification of animals, from Aristotle on, the instincts peculiar to each species have been used in their differentiation. In addition, the degree to which the instincts of an animal

are either relatively inflexible at one extreme or easily modifiable at the other has been thought to indicate that animal's rank in the scale of intelligence. The higher animals seem to have a greater capacity to form habits and to be capable, therefore, of modifying their instinctive patterns of behavior as the result of experience. In consequence, their behavior is both more adaptive and more variable than that of animals which always follow the lines of action laid down by instinct.

Species whose instincts are largely unmodifiable are at a disadvantage in a changing environment or in one to which they are not innately adapted. In the struggle for existence, Darwin observes, it is the organism that "varies ever so little, either in habits or structure" which "gains an advantage over some other inhabitant of the same country." Though for the most part instincts seem to be directed toward the animal's survival, intelligence, or the power of modifying instincts by learning, may sometimes be needed to save the animal from his own instincts.

If the lower animals are most dependent on their instincts and least able to modify them, that would seem to indicate a kind of opposition between instinct and intelligence. Darwin quotes Cuvier to the effect that "instinct and intelligence stand in an inverse ratio to each other," but he himself does not wholly accept this view. He thinks that the behavior of beavers, for example, or of certain classes of insects, shows that "a high degree of intelligence is certainly compatible with complex instincts." Yet he admits that "it is not improbable that there is a certain amount of interference between the development of free intelligence and of instinct."

On this subject of instinct in relation to intelligence or reason, James seems to take a less equivocal position. According to him, "man possesses all the impulses that [animals] have, and a great many more besides." After enumerating what he considers to be the instinctive tendencies of the human species, he concludes by saying that "no other mammal, not even the monkey, shows so large an array." But since James also thinks that man has the keenest intelligence and may even be the only reasoning animal, he cannot believe that there is any "material antagonism between instinct and reason." On the

contrary, a high development of the faculties of memory, of associating ideas, and of making inferences implies not the absence of instinct, but the modifiability of instinct by experience and learning. "Though the animal richest in reason might be also the animal richest in instinctive impulses too," James writes, "he would never seem the fatal automaton which a *merely* instinctive animal would be."

The opposite position is taken by those who, like Cuvier, hold that the more adequate an animal's instinctive equipment is for its survival, the less it needs free intelligence for adaptive purposes, and the less important is the role of learning and habit formation. Some writers, like Aquinas, go further than this and maintain that in the case of man, the power of reason as an instrument of learning and of solving life's problems supplants instinct almost entirely, or needs to be supplemented by instinctive impulses of an extremely rudimentary sort—hardly more complex than simple reflexes.

What other animals do by instinct man does by reason. "Brute animals," Aquinas writes, "do not act at the command of reason," but "if they are left to themselves, such animals act from natural instinct." Since in his opinion habits can be formed only by acts which involve reason as a factor, he does not think that, strictly speaking, habits are to be found in brutes. But, he adds, to the extent that man's reason may influence brutes "by a sort of conditioning to do things in this or that way, so in this sense to a certain extent we can admit the existence of habits in brute animals."

THE MODIFICATION of instincts in the course of individual life raises a question about their modifiability from generation to generation. The question has obvious significance for the theory of evolution.

It is thought by some that an animal's instincts represent the past experience of the race. In a passage quoted by James, Herbert Spencer, for example, maintains that "reflex actions and instincts . . . result from the registration of experience continued for numberless generations." Freud appears to hold much the same opinion. "All organic instincts are conservative," he writes. They are "historically acquired, and are directed towards regressions, towards reinstatement

of something earlier." Indeed, he claims that the instincts of living things revert back *beyond* ancestral history to the inorganic. They go back to "an ancient starting point, which the living being left long ago." They are an "imprint" left upon the development of the organism by "the evolution of our earth and its relation to the sun."

James, on the other hand, claims that there is "perhaps not one single unequivocal item of positive proof" in favor of the view that "adaptive changes are inherited." He thinks the variability of instincts from generation to generation must be accounted for by some other means than the inheritance of acquired characteristics, according to which the habits *acquired* by earlier generations gradually become, through hereditary transmission, the *innate* habits of later generations.

The question of their origin aside, what is the structure of instincts? In the chapter on EMOTION, where this matter is considered, instinctive behavior is described as having three components. It involves, first, an innate ability to recognize certain objects; second, an emotional reaction to them which includes an impulse to act in a certain way; and, third, the ability to execute that impulse without benefit of learning.

James covers two of these three points when he defines an instinct as "the faculty of acting in such a way as to produce certain ends, without foresight of the ends, and without previous education in the performance"; and he touches on the remaining one when he declares that "instinctive reactions and emotional expressions shade imperceptibly into each other. Every object that excites an instinct," he goes on to say, "excites an emotion as well," but emotions "fall short of instincts in that the emotional reaction usually terminates in the subject's own body, whilst the instinctive reaction is apt to go further and enter into practical relations with the exciting object."

In the discussion of instincts from Aristotle to Freud, the emphasis on one or another of these components has varied from time to time. Mediaeval psychologists, if we take Aquinas as an example, seem to stress the cognitive aspect. He speaks of the sheep running away "when it sees the wolf, not because of its color or shape, but as a natural enemy." The point which he thinks

notable here is not the fact that the sheep runs away, but rather the fact that without any previous experience of wolves, the sheep recognizes the wolf as dangerous. "The sheep, seeing the wolf, judges it a thing to be shunned . . . not from deliberation, but from natural instinct." This instinctive power of recognizing what is to the animal's advantage or peril Aquinas calls "the estimative power" and assigns it, along with memory and imagination, to the sensitive faculty.

Later writers stress the emotional and conative aspects of instinct—feeling and impulse. James, for example, indicates this emphasis when he says that "every instinct is an impulse"; and Freud makes desire central rather than perception or action. An instinct, he says, may be described as a stimulus, but it would be more exact to speak of "a stimulus of instinctual origin" as a "need." The instincts are the basic cravings or needs, and these instinctual needs are the primary unconscious determinants of behavior and thought.

What Freud calls "instinctual needs" seem to be the counterpart of what, in an earlier phase of the tradition, are called "natural desires." These two notions are far from being strictly interchangeable, but they do have a certain similarity in their reference to desires which are not conscious or acquired through experience. This matter is further discussed in the chapter on *DESIRE*.

IF WE TURN NOW to the consideration of habit as something acquired by the individual, we find two major issues. The first of these has already been mentioned in connection with the conception of habit as a *retained effect*.

According to William James, the capacity for habit formation is a general property of nature, found in inanimate matter as well as in living things. "The moment one tries to define what habit is," he writes, "one is led to the fundamental properties of matter." He regards the laws of nature, for example, as "nothing but the immutable habits which the different elementary sorts of matter follow in their actions and reactions upon each other. In the organic world, however, the habits are more variable than this."

James attributes this universal capacity for habit formation to what he calls the "plasticity"

of matter, which consists in "the possession of a structure weak enough to yield to an influence, but strong enough not to yield all at once. Each relatively stable phase of equilibrium in such a structure is marked by what we may call a new set of habits." He cites as examples of habit formation in inorganic matter such things as the magnetizing of an iron bar, the setting of plaster, scratches on a polished surface or creases in a piece of cloth. The matter in each of these cases is not only plastic and yielding, but retentive through its inertia. "When the structure has yielded," he writes, "the same inertia becomes the condition of its comparative permanence in the new form, and of the new habits the body then manifests."

The habits of living things or of the human mind are to be regarded only as special cases of nature's general plasticity and retentiveness. James does not fail to observe the difference between the magnetized bar, the scratched surface, or the creased cloth, and the habits of a trained animal or a skilled workman. The latter are acquired by activity—by practicing the same act repeatedly. Furthermore, they are not merely passive relics of a past impression, but are themselves tendencies to action. They erupt into action almost spontaneously when the occasion for performance arises.

It may be questioned whether the word "habit" should be used so broadly. Unlike James, most writers restrict its application to living things, and even there they limit habit formation to the sphere of learning. If the capacity to learn from experience is not a property of plant life, then plants cannot form habits. The same may be said of certain species of animals whose activity is entirely and inflexibly instinctive. Habits are possessed only by those organisms—animals or men—whose future conduct can be determined by their own past behavior. Aquinas, as we have seen, goes further than this, and limits habit formation in a strict sense to man alone.

This leads at once to the second issue. For those who believe that man is not specifically different from all other animals, man's habits and his habit formation require no special distinction or analysis. They hold that human intelligence differs from animal intelligence only in degree, not in kind. No other factors, they think, are present in human learn-

ing than those which operate when animals somehow profit from experience or acquire new modes of behavior. In the great books there is to be found, however, a very special theory of habit which is part of the doctrine that man is specifically different from all other animals in that he alone is rational and has free will.

The issue about man's nature is discussed in other chapters (ANIMAL, EVOLUTION, MAN, MIND). Here we must examine the consequences for the theory of habit of these opposing views. Do animals and men form habits *in the same sense* of that term? The use of the word is not at stake, for "habit" may be used in a different sense for the acquired dispositions of animals. Those who hold that brute animals and men do not have habits in the same sense acknowledge that men may have, in addition to their specifically human habits, the sort of modified instincts or conditioned reflexes which are typical of animal habit formation. Furthermore, it is recognized that human and animal habits are alike in certain respects. Both are acquired by activity and both are tendencies to activity of a determinate sort.

The question, therefore, is simply this: Does one conception of habit apply to men and animals, or does human nature require a special conception applicable to man alone? To clarify this issue, it is necessary to summarize the analysis of human habits which Aristotle and Aquinas develop more fully than other writers, even than those who share their view of the rationality and freedom of man.

THAT ARISTOTLE and Aquinas should be the authors of an elaborate theory of human habits becomes intelligible in terms of two facts.

In the first place, they consider habit in the context of moral theory. For them the virtues, moral or intellectual, are habits, and so necessarily are the opposite vices. Virtues are good habits; vices bad habits; hence, good or bad, human habits must be so formed and constituted that they can have the moral quality connoted by virtue or vice. Since virtue is praiseworthy and vice blameworthy only if their possessor is responsible, human habit is conceived as arising from freely chosen acts.

In the second place, their understanding of habit is affected by their psychological doctrine

of faculties, and especially by their analysis of the powers and activities which they think belong peculiarly to man. This in turn gives a metaphysical meaning to habit, for they treat human powers and human acts as special cases of potentiality and actualization.

Aquinas bases much of his discussion of habit on Aristotle's definition of it as "a disposition whereby that which is disposed is disposed well or ill, and this, either in regard to itself or in regard to another." In calling a habit a disposition, Aristotle goes on to say that all "dispositions are not necessarily habits," for while dispositions are unstable or ephemeral, habits "are permanent" or at least "difficult to alter."

For a disposition to be a habit, certain other conditions must be present, according to Aquinas. "That which is disposed should be distinct from that to which it is disposed," he writes, and hence "should be related to it as potentiality is to act." If there is a being which lacks all potentiality, he points out, "we can find no room in such a thing for habit . . . as is clearly the case in God."

It is also necessary that "that which is in a state of potentiality in regard to something else be capable of determination in several ways and to various things." If there were a potentiality which could be actualized in one way and one way only, then such a power of operation could not be determined by habits. Some of man's powers seem to be of this sort. His faculty of sensation, for example, functions perfectly when the sense organs have normally matured. A man does not learn to *see* colors or to *hear* tones, and so the simple use of his senses—apart from aesthetic perceptions and trained discriminations—does not lead to sensory habits. "The exterior apprehensive powers, as sight, hearing, and the like," Aquinas maintains, "are not susceptible of habits but are ordained to their fixed acts, according to the disposition of their nature."

In contrast, man's faculty of thinking and knowing can be improved or perfected by activity and exercise. The words "improved" and "perfected" are misleading if they are thought to exclude bad habits, for a bad habit is no less a habit than a good one. The definition of habit, Aquinas points out, includes dispositions which "dispose the subject well or

ill to its form or to its operation." Hence when we say that a power of operation is "improved" or "perfected" by being exercised, we must mean only that after a number of particular acts, the individual has a *more determinate* capacity for definite operation than he had before.

A man may have at birth the mere capacity for knowing grammar or geometry, but after he has learned these subjects he has the habit of such knowledge. This, according to Aristotle and Aquinas, means that his original capacity has been rendered more determinate in its activity. It would be so even if he had learned errors, that is, even if the intellectual habits he had formed disposed his mind in a manner which would be called "ill" rather than "well."

The difference between a man who has learned grammar and one who has not is a difference in their capacity for a certain intellectual performance, a difference resulting from the intellectual work which has been done by the man who has learned grammar. That difference is an intellectual habit. The man who has not learned grammar has the same undeveloped capacity for knowing grammar with which he was born. The man who has learned grammar has had his native capacity for grammatical knowledge developed. That developed capacity is a habit of knowledge or skill which manifests itself in the way in which he writes and speaks. But even when he is not actually exercising his grammatical skill, the fact that he has formed this particular habit means that he will be able, whenever the occasion arises, to do correctly with speed and facility what the man who does not have the habit cannot do readily or easily if he can do it at all.

It may be helpful to illustrate the same points by reference to a bodily habit, such as a gymnastic or athletic skill which, being an art, is a habit not of body alone, but of mind as well. If two men are born with normal bodies equally capable of certain muscular coordinations, they stand in the same relation to performing on the tennis court. Both are equally able to learn the game. But when one of them has learned to play, his acquired skill consists in the trained capacity for the required acts or motions. The other man may be able to perform all these acts or go through all these motions, but not with the same facility and grace, or as pleasantly, as

the man whose mastery of the game lies in a habit formed by much practice in doing what is required. As the habit gradually grows, awkwardness is overcome, speed increases, and pleasure in performance replaces pain or difficulty.

Clearly, then, the habit exists even when it is not in operation. It may even develop during periods of inactivity. As William James remarks, there is a sense in which "we learn to swim during the winter and to skate during the summer" when we are not actually engaging in these sports. This would seem to be inconsistent with the general insight, common to all observers, that habits are strengthened by exercise and weakened or broken by disuse or by the performance of contrary acts. But James explains that his point, stated less paradoxically, means only that during periods of rest the effects of prior activity seem to consolidate and build up a habit.

The dynamism of habit formation and habitual activity is summarized, in the language of Aristotle and Aquinas, by the statement that "habit is a kind of medium between mere power and mere act." On the one hand, a habit is like a power or capacity, for though it is an improvement on native ability, it is still only an ability to perform certain acts; it is *not* the actual performance of them. On the other hand, habit is like operation or activity, for it represents an actualization or development of capacity, even as a particular operation is an actualization of the power to act. That is why habit is sometimes called a second grade of potentiality (compared to natural capacity as first potentiality) and also "a first grade of actuality" (compared to operation as complete act).

ACCORDING TO THE theory of specifically human habits, habits are situated only in man's powers of reason and will. Habits are formed in the other powers only to the extent that they are subject to direction by his reason and will. Specifically human habits can be formed only in that area of activity in which men are free to act or not to act; and, when they act, free to act this way or that. Habit, the product of freedom, is not thought of as abolishing freedom. However difficult it may be to exert a free choice against a strong habit, even the strongest

habit is not conceived as unbreakable; and if it is breakable, it must permit action contrary to itself. Habitual behavior only seems to lack freedom because a man does habitually, without conscious attention to details, what he would be forced to do by conscious choice at every step if he lacked the habit.

In the theory under consideration habits are classified according to the faculty which they determine or perfect, on the ground that "every power which may be variously directed to act needs a habit whereby it is well disposed to its act." Consequently there are intellectual habits, or habits of thinking and knowing; and appetitive habits, or habits of desire which involve the emotions and the will, and usually entail specific types of conduct. Within a single faculty, such as the intellect, habits are further differentiated by reference to their objects or to the end to which their characteristic operation is directed. For example, the habit of knowing which consists in a science like geometry and the habit of artistic performance such as skill in grammar both belong to the intellect, but they are distinct habits according to their objects or ends.

All of these distinctions have moral as well as psychological significance. They are used in formulating the criteria of *good* and *bad* habits which are more appropriately discussed in the chapter on VIRTUE AND VICE. But here one further psychological distinction deserves comment. Some of man's acquired habits are regarded as natural in a special sense—not in the sense in which instincts are called "natural" or "innate" habits. The distinction is drawn from the supposition that certain habits develop in *all* men because, since human nature is the same for all, men will inevitably form these habits if they act at all. This word "natural" here applied to a habit simply means that it is common to all having the same nature.

For example, the understanding of the law of contradiction—that *the same thing cannot be affirmed and denied at the same time*—and other simple axioms of theoretic knowledge are said to be possessed by the human mind as a matter of natural habit. If a man thinks at all he will come to know these truths. "It is owing to the very nature of the intellectual soul," Aquinas writes, "that man, having once grasped what is

a whole and what is a part, should at once perceive that every whole is larger than its part."

The sense in which Aquinas says that "*the understanding of first principles*" is called a natural habit" applies to the first principles of the practical reason as well as to the axioms of theoretic knowledge. Just as no man who makes theoretic judgments about the true and the false can be, in his opinion, without habitual knowledge of the principle of contradiction, so he thinks no man who makes practical judgments about good and evil can be without habitual knowledge of the natural moral law, the first principle of which is that *the good is to be sought and evil avoided*. "Since the precepts of the natural law are sometimes considered by reason actually," Aquinas writes, "while sometimes they are in the reason only habitually, in this way the natural law may be called a habit."

In a different phase of the tradition Hume regards it as an inevitable tendency of the human mind to interpret any repeated sequence of events in terms of cause and effect. If one thing has preceded another a certain number of times in our experience, we are likely to infer that if the first occurs, the second will follow. The principle which determines us "to form such a conclusion" is, Hume says, "Custom or Habit." All our inferences from experience are "effects of custom, not of reasoning"; and since the habit of inferring a future connection between things which have been customarily conjoined in the past is, in his opinion, universally present in human nature, Hume refers to it as "a species of natural instinct which no reasoning or process of thought and understanding is able either to produce or prevent."

Even Kant's synthetic judgments *a priori* have a certain similarity to the thing called "natural habit." They comprise judgments the mind will make because of its own nature or, in Kant's terms, its transcendental structure. Though *a priori*, the judgment itself is not innate, for it arises only when actual experience provides its subject matter. So, too, the natural habit of first principles, of which Aquinas speaks, is not innate, but a result of experience.

THERE IS STILL ONE other traditional meaning of the phrase "natural habit." It occurs in

Christian theology. Habits are there distinguished according as they are acquired by man's own efforts or are a gift of God's grace, which adds to or elevates human nature. The former are natural, the latter supernatural.

In the sphere of supernatural habits the theologian makes a distinction between grace itself and the special habits which accompany grace. Aquinas, for example, writes that "just as the natural light of reason is something different from the acquired virtues, which are ordained to this natural light, so also the light of grace, which is a participation of the divine nature, is something different from the infused virtues which are derived from and are ordained to this light." These "infused virtues," like the natural virtues, are good habits—principles of operation, determining acts of thought or desire. They are either the specifically theological virtues of faith, hope, and charity, or the supernatural counterparts of the acquired intellectual and moral virtues—the habits which are called "the infused virtues" and "the moral and intellectual gifts."

Grace, taken in itself rather than in its consequences, is not an *operative* habit, that is, it is not a habit of performing certain acts. Nevertheless, regarded as something added to and perfecting nature, it is considered under the aspect of habit. But rather than "a habit whereby power is inclined to an act," Aquinas includes it among those habits by which "the nature is well or ill disposed to something, and chiefly when such a disposition has become a sort of nature." Through the habit of grace, man's nature is elevated by becoming "a partaker . . . of the divine nature."

To distinguish this kind of habit from those in the operative order, it is sometimes called an "entitative habit"—a habit of the very *being* of man's personality. On the purely natural plane, health may be thought of in the same way as a habit which is entitative rather than operative. It is a habit not of thought, desire, or conduct, but of man's physical being.

THE WORD "CUSTOM" is sometimes a synonym for "habit" and sometimes a variant with special connotations. What a man does habitually is customary for him to do. So far as the single individual is concerned, there seems to be no

difference between habit and custom. But we usually think of customs in terms of the group or community rather than the individual. As indicated in the chapter on CUSTOM AND CONVENTION, the prevailing modes of behavior in a society and its widely shared beliefs represent common habits of thought and action on the part of its members. Apart from the habits of individuals social customs have no existence whatsoever. But social customs and individual habits cannot be equated because, with respect to any customary practice or opinion, there may be non-conforming individuals—men of divergent habit. The prevalent or predominant customs are the habits of the majority.

No society endures for long or functions peacefully unless common habits generate the ties of custom. To perpetuate itself, the state necessarily attempts to mould the habits of each growing generation—by every means of education, by tradition, by law. So important is the stability of custom in the life of society, according to Montaigne, that it is "very unjust . . . to subject public and established customs and institutions to the weakness and instability of a private and particular fancy." He doubts "whether any so manifest benefit can accrue from the alteration of a law received, let it be what it will, as there is danger and inconvenience in altering it." His extreme caution with regard to changing the law comes from a preference for the stability of settled customs and from the recognition that "government is a structure composed of diverse parts and members joined and united together, with so strict connection, that it is impossible to stir so much as one brick or stone, but the whole body will be sensible of it."

Without habits of action, at least, neither the individual nor society can avoid chaos. Habits bind day to day in a continuity which would be lost if the recurring problems of conduct or thought had to be solved anew each time they arose. Without habits life would become unbearably burdensome; it would bog down under the weight of making decisions. Without habits men could not live with themselves, much less with one another. Habits are, as William James remarks, "the fly-wheel of society."

OUTLINE OF TOPICS

	PAGE
1. Diverse conceptions of habit: as second nature, perfection of power, retained modification of matter	674
1a. Habit in relation to potency and act	
1b. Habit in relation to the plasticity of matter	675
2. The kinds of habit: the distinction of habit from disposition and other qualities	
2a. Differentiation of habits according to origin and function: innate and acquired, entitative and operative habits	
2b. Differentiation of habits according to the capacity habituated or to the object of the habit's activity	
3. The instincts or innate habits of animals and men	
3a. Instinctual needs or drives	
3b. The innate sense of the beneficial and harmful: the estimative power	676
3c. Instinct in relation to reason	
3d. The instinctive basis of habit-formation: the modification of instincts and reflexes through experience or learning	677
3e. The genesis, transmission, and modification of instincts in the course of generations	
4. Habit formation	
4a. The causes of habit: practice, repetition, teaching, and the law	
4b. The growth and decay of habits: ways of strengthening and breaking habits	
5. The analysis of specifically human habits	678
5a. Habits of body: manual arts and the skills of play	
5b. Habits of appetite and will: the moral virtues as good habits	
5c. The natural habits of reason: innate predispositions of the mind	
5d. The acquired habits of mind: the intellectual virtues	679
5e. Supernatural habits	
(1) Grace as an entitative habit of the person	
(2) The infused virtues and the supernatural gifts	
(3) The theological virtues	680
6. The force of habit in human life	
6a. The automatic or unconscious functioning of habits	
6b. The contribution of habit to the perfection of character and mind	
6c. Habit and freedom	681
7. The social significance of habit: habit in relation to law	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 33: HAPPINESS

INTRODUCTION

THE great questions about happiness are concerned with its definition and its attainability. In what does happiness consist? Is it the same for all men, or do different men seek different things in the name of happiness? Can happiness be achieved on earth, or only hereafter? And if the pursuit of happiness is not a futile quest, by what means or steps should it be undertaken?

On all these questions, the great books set forth the fundamental inquiries and speculations, as well as the controversies to which they have given rise, in the tradition of western thought. There seems to be no question that men want happiness. "Man wishes to be happy," Pascal writes, "and only wishes to be happy, and cannot wish not to be so." To the question, what moves desire? Locke thinks only one answer is possible: "happiness, and that alone."

But this fact, even if it goes undisputed, does not settle the issue whether men are right in governing their lives with a view to being or becoming happy. There is therefore one further question. *Should* men make happiness their goal and direct their acts accordingly?

According to Kant, "the principle of *private* happiness" is "the direct opposite of the principle of morality." He understands happiness to consist in "the satisfaction of all our desires: *extensive*, in regard to their multiplicity; *intensive*, in regard to their degree; *protensive*, in regard to their duration." What Kant calls the "pragmatic" rule of life, which aims at happiness, "tells us what we have to do, if we wish to become possessed of happiness."

Unlike the moral law, it is a hypothetical, not a categorical, imperative. Furthermore, Kant points out that such a pragmatic or utilitarian ethics (which is for him the same as an "ethics of happiness") cannot help being em-

pirical, "for it is only by experience," he says, "that I can learn either what inclinations exist which desire satisfaction, or what are the natural means of satisfying them." Such empirical knowledge "is available for each individual in his own way." Hence there can be no universal solution in terms of desire of the problem of how to be happy. To reduce moral philosophy to "a theory of happiness" must result, therefore, in giving up the search for ethical principles which are both universal and *a priori*.

In sharp opposition to the pragmatic rule, Kant sets the "moral or ethical law," the motive of which is not simply to be happy, but rather to be *worthy* of happiness. In addition to being a categorical imperative which imposes an absolute obligation upon us, this law, he says, "takes no account of our desires or the means of satisfying them." Rather it "dictates how we ought to act in order to deserve happiness." It is drawn from pure reason, not from experience, and therefore has the universality of an *a priori* principle, without which, in Kant's opinion, a genuine science of ethics—or metaphysic of morals—is impossible.

With the idea of moral worth—that which alone deserves happiness—taken away, "happiness alone is," according to Kant, "far from being the complete good. Reason does not approve of it (however much inclination may desire it) except as united with desert. On the other hand," Kant admits, "morality alone, and, with it, mere *desert*, is likewise far from being the complete good." These two things must be united to constitute the true *summum bonum* which, according to Kant, means both the *supreme* and the *complete* good. The man "who conducts himself in a manner not unworthy of happiness, must be able to hope for the possession of happiness."

But even if happiness combined with moral

worth does constitute the supreme good, Kant still refuses to admit that happiness, as a practical objective, can function as a moral principle. Though a man can hope to be happy only if under the moral law he does his duty, he should not do his duty with the hope of thereby becoming happy. "A disposition," he writes, "which should require the prospect of happiness as its necessary condition, would not be moral, and hence also would not be worthy of complete happiness." The moral law commands the performance of duty *unconditionally*. Happiness should be a consequence, but it cannot be a condition, of moral action.

In other words, happiness fails for Kant to impose any moral obligation or to provide a standard of right and wrong in human conduct. No more than pleasure can happiness be used as a first principle in ethics, if morality must avoid all calculations of utility or expediency whereby things are done or left undone for the sake of happiness, or any other end to be enjoyed.

THIS ISSUE BETWEEN an ethics of duty and an ethics of happiness, as well as the conflict it involves between law and desire as sources of morality, are considered, from other points of view, in the chapters on *DESIRE* and *DUTY*, and again in *GOOD AND EVIL* where the problem of the *summum bonum* is raised. In this chapter, we shall be concerned with happiness as an ethical principle, and therefore with the problems to be faced by those who, in one way or another, accept happiness as the supreme good and the end of life. They may see no reason to reject moral principles which work through desire rather than duty. They may find nothing repugnant in appealing to happiness as the ultimate end which justifies the means and determines the order of all other goods. But they cannot make happiness the first principle of ethics without having to face many questions concerning the nature of happiness and its relation to virtue.

Discussion begins rather than ends with the fact that happiness is what all men desire. Once they have asserted that fact, once they have made happiness the most fundamental of all ethical terms, writers like Aristotle or Locke, Aquinas or Mill, cannot escape the question

whether *all* who seek happiness look for it or find it in the *same* things.

Holding that a definite conception of happiness cannot be formulated, Kant thinks that happiness fails even as a pragmatic principle of conduct. "The notion of happiness is so indefinite," he writes, "that although every man wishes to attain it, yet he never can say definitely and consistently what it is that he really wishes." He cannot "determine with certainty what would make him truly happy; because to do so he would need to be omniscient." If this is true of the individual, how various must be the notions of happiness which prevail among men in general.

Locke plainly asserts what is here implied, namely, the fact that "everyone does not place his happiness in the same thing, or choose the same way to it." But admitting this fact does not prevent Locke from inquiring how "in matters of happiness and misery . . . men come often to prefer the worse to the better; and to choose that which, by their own confession, has made them miserable." Even though he declares that "the same thing is not good to every man alike," Locke thinks it is possible to account "for the misery that men often bring on themselves" by explaining how the individual may make errors in judgment—"how things come to be represented to our desires under deceitful appearances . . . by the judgment pronouncing wrongly concerning them."

But this applies to the individual only. Locke does not think it is possible to show that when two men differ in their notions of happiness, one is right and the other wrong. "Though all men's desires tend to happiness, yet they are not moved by the same object. Men may choose different things, and yet all choose right." He does not quarrel with the theologians who, on the basis of divine revelation, describe the eternal happiness in the life hereafter which is to be enjoyed *alike* by all who are saved. But revelation is one thing, and reason another.

With respect to temporal happiness on earth, reason cannot achieve a definition of the end that has the certainty of faith concerning salvation. Hence Locke quarrels with "the philosophers of old" who, in his opinion, vainly sought to define the *summum bonum* or happiness in such a way that all men would agree on what

happiness is; or, if they failed to, some would be in error and misled in their pursuit of happiness.

It may be wondered, therefore, what Locke means by saying that there is a science of what man ought to do "as a rational and voluntary agent for the attainment of . . . happiness." He describes ethics as the science of the "rules and measures of human actions, which lead to happiness" and he places "morality amongst the sciences capable of demonstration, wherein . . . from self-evident propositions, by necessary consequences, as incontestable as those in mathematics, the measures of right and wrong might be made out, to any one that will apply himself with the same indifference and attention to the one, as he does to the other of these sciences."

THE ANCIENT philosophers with whom Locke disagrees insist that a science of ethics depends on a first principle which is self-evident in the same way to all men. Happiness is not that principle if the content of happiness is what each man thinks it to be; for if no universally applicable definition of happiness can be given—if when men differ in their conception of what constitutes happiness, one man may be as right as another—then the fact that all men agree upon giving the name "happiness" to what they ultimately want amounts to no more than a nominal agreement. Such nominal agreement, in the opinion of Aristotle and Aquinas, does not suffice to establish a science of ethics, with rules for the pursuit of happiness which shall apply universally to all men.

On their view, what is truly human happiness must be the same for all men. The reason, in the words of Aquinas, is that "all men agree in their specific nature." It is in terms of their specific or common nature that happiness can be objectively defined. Happiness so conceived is a common end for all, "since nature tends to one thing only."

It may be granted that there are in fact many different opinions about what constitutes happiness, but it cannot be admitted that all are equally sound without admitting a complete relativism in moral matters. That men do *in fact* seek different things under the name of happiness does not, according to Aristotle and Aquinas, alter the truth that the happiness they

should seek must be something appropriate to the humanity which is common to them all, rather than something determined by their individually differing needs or temperaments. If it were the latter, then Aristotle and Aquinas would admit that questions about what men should do to achieve happiness would be answerable only by individual opinion or personal preference, not by scientific analysis or demonstration.

With the exception of Locke and perhaps to a less extent Mill, those who think that a science of ethics can be founded on happiness as the first principle tend to maintain that there can be only one right conception of human happiness. They regard other notions as misconceptions which may appear to be, but are not really the *summum bonum*. The various definitions of happiness which men have given thus present the problem of the real and the apparent good, the significance of which is considered in the chapter on GOOD AND EVIL.

IN THE EVERYDAY discourse of men there seems to be a core of agreement about the meaning of the words "happy" and "happiness." This common understanding has been used by philosophers like Aristotle and Mill to test the adequacy of any definition of happiness.

When a man says "I feel happy" he is saying that he feels pleased or satisfied—that he has what he wants. When men contrast tragedy and happiness, they have in mind the quality a life takes from its end. A tragedy on the stage, in fiction, or in life is popularly characterized as "a story without a happy ending." This expresses the general sense that happiness is the quality of a life which comes out well on the whole despite difficulties and vicissitudes along the way. Only ultimate defeat or frustration is tragic.

There appears to be some conflict here between *feeling* happy at a given moment and *being* happy for a lifetime, that is, living happily. It may be necessary to choose between having a good time and leading a good life. Nevertheless, in both uses of the word "happy" there is the connotation of satisfaction. When men say that what they want is happiness, they imply that, having it, they would ask for nothing more. If they are asked why they want to be

happy, they find it difficult to give any reason except "for its own sake." They can think of nothing beyond happiness for which happiness serves as a means or a preparation. This aspect of ultimacy or finality appears without qualification in the sense of happiness as belonging to a whole life. There is quiescence, too, in the momentary feeling of happiness, but precisely because it does not last, it leaves another and another such moment to be desired.

Observing these facts, Aristotle takes the word "happiness" from popular discourse and gives it the technical significance of ultimate good, last end, or *summum bonum*. "The chief good," he writes, "is evidently something final. . . . Now we call that which is in itself worthy of pursuit more final than that which is worthy of pursuit for the sake of something else, and that which is never desirable for the sake of something else more final than the things that are desirable both in themselves and for the sake of that other thing. Therefore, we call final without qualification that which is always desirable in itself and never for the sake of something else. Such a thing happiness, above all else, is held to be; for this we choose always for itself and never for the sake of something else."

The ultimacy of happiness can also be expressed in terms of its completeness or sufficiency. It would not be true that happiness is desired for its own sake and everything else for the sake of happiness, if the happy man wanted something more. The most obvious mark of the happy man, according to Aristotle, is that he wants for nothing. The happy life leaves nothing to be desired. It is this insight which Boethius later expresses in an oft-repeated characterization of happiness as "a life made perfect by the possession in aggregate of all good things." So conceived, happiness is not a particular good itself, but the sum of goods. "If happiness were to be counted as one good among others," Aristotle argues, "it would clearly be made more desirable by the addition of even the least of goods." But then there would be something left for the happy man to desire, and happiness would not be "something final and self-sufficient and the end of action."

Like Aristotle, Mill appeals to the common sense of mankind for the ultimacy of happiness.

"The utilitarian doctrine," he writes, "is that happiness is desirable, and the only thing desirable as an end; all other things being only desirable as means." No reason can or need be given why this is so, "except that each person, so far as he believes it to be attainable, desires his own happiness." This is enough to prove that happiness is *a* good. To show that it is *the* good, it is "necessary to show, not only that people desire happiness, but that they never desire anything else."

Here Mill's answer, like Aristotle's, presupposes the rightness of the prevailing sense that when a man is happy, he has everything he desires. Many things, Mill admits, may be desired for their own sake, but if the possession of any one of these leaves something else to be desired, then it is desired only as a part of happiness. Happiness is "a concrete whole, and these are some of its parts. . . . Whatever is desired otherwise than as a means to some end beyond itself, and ultimately to happiness, is desired as itself a part of happiness, and is not desired for itself until it has become so."

THERE ARE OTHER conceptions of happiness. It is not always approached in terms of means and ends, utility and enjoyment or satisfaction. Plato, for example, identifies happiness with spiritual well-being—a harmony in the soul, an inner peace which results from the proper order of all the soul's parts.

Early in the *Republic*, Socrates is challenged to show that the just man will be happier than the unjust man, even if in all externals he seems to be at a disadvantage. He cannot answer this question until he prepares Glaucon for the insight that justice is "concerned not with the outward man, but with the inward." He can then explain that "the just man does not permit the several elements within him to interfere with one another. . . . He sets in order his own inner life, and is his own master and his own law, and is at peace with himself."

In the same spirit Plotinus asks us to think of "two wise men, one of them possessing all that is supposed to be naturally welcome, while the other meets only with the very reverse." He wants to know whether we would "assert that they have an equal happiness." His own answer is that we should, "if they are equally

wise . . . [even] though the one be favored in body and in all else that does not help towards wisdom." We are likely to misconceive happiness, Plotinus thinks, if we consider the happy man in terms of our own feebleness. "We count alarming and grave what his felicity takes lightly; he would be neither wise nor in the state of happiness if he had not quitted all trifling with such things."

According to Plotinus, "Plato rightly taught that he who is to be wise and to possess happiness draws his good from the Supreme, fixing his gaze on That, becoming like to That, living by That . . . All else he will attend to only as he might change his residence, not in expectation of any increase in his settled felicity, but simply in a reasonable attention to the differing conditions surrounding him as he lives here or there." If he "meets some turn of fortune that he would not have chosen, there is not the slightest lessening of his happiness for that." Like Plato, Plotinus holds that nothing external can separate a virtuous man from happiness—that no one can injure a man except himself.

The opposite view is more frequently held. In his argument with Callicles in the *Gorgias*, Socrates meets with the proposition that it is better to injure others than to be injured by them. This can be refuted, he thinks, only if Callicles can be made to understand that the unjust or vicious man is miserable in himself, regardless of his external gains. The fundamental principle, he says, is that "the happy are made happy by the possession of justice and temperance and the miserable miserable by the possession of vice." Happiness is one with justice because justice or virtue in general is "the health and beauty and well-being of the soul."

This association of happiness with health—the one a harmony in the soul as the other is a harmony in the body—appears also in Freud's consideration of human well-being. For Freud, the ideal of health, not merely bodily health but the health of the whole man, seems to identify happiness with peace of mind. "Anyone who is born with a specially unfavorable instinctual constitution," he writes, "and whose libido-components do not go through the transformation and modification necessary for suc-

cessful achievement in later life, will find it hard to obtain happiness." The opposite of happiness is not tragedy but neurosis. In contrast to the neurotic, the happy man has found a way to master his inner conflicts and to become well-adjusted to his environment.

The theory of happiness as mental health or spiritual peace may be another way of seeing the self-sufficiency of happiness, in which all striving comes to rest because all desires are fulfilled or quieted. The suggestion of this point is found in the fact that the theologians conceive beatitude, or supernatural happiness, in both ways. For them it is both an ultimate end which satisfies all desires and also a state of peace or heavenly rest.

"The ultimate good," Augustine writes, "is that for the sake of which other things are to be desired, while it is to be desired for its own sake"; and, he adds, it is that by which the good "is finished, so that it becomes complete"—all-satisfying. But what is this "final blessedness, the ultimate consummation, the unending end"? It is peace. "Indeed," Augustine says, "we are said to be blessed when we have such peace as can be enjoyed in this life; but such blessedness is mere misery compared to that final felicity," which can be described as "either peace in eternal life or eternal life in peace."

THERE MAY BE differences of another kind among those who regard happiness as their ultimate end. Some men identify happiness with the possession of one particular type of good—wealth or health, pleasure or power, knowledge or virtue, honor or friendship—or, if they do not make one or another of these things the only component of happiness, they make it supreme. The question of which is chief among the various goods that constitute the happy life is the problem of the order of goods, to which we shall return presently. But the identification of happiness with some one good, to the exclusion or neglect of the others, seems to violate the meaning of happiness on which there is such general agreement. Happiness cannot be that which leaves nothing to be desired if any good—anything which is in any way desirable—is overlooked.

But it may be said that the miser desires nothing but gold, and considers himself happy

when he possesses a hoard. That he may consider himself happy cannot be denied. Yet this does not prevent the moralist from considering him deluded and in reality among the unhappiest of men. The difference between such illusory happiness and the reality seems to depend on the distinction between conscious and natural desire. According to that distinction, considered in the chapter on *DESIRE*, the miser may have all that he consciously desires, but lack many of the things toward which his nature tends and which are therefore objects of natural desire. He may be the unhappiest of men if, with all the wealth in the world, yet self-deprived of friends or knowledge, virtue or even health, his exclusive interest in one type of good leads to the frustration of many other desires. He may not consciously recognize these, but they nevertheless represent needs of his nature demanding fulfillment.

As suggested in the chapter on *DESIRE*, the relation of natural law to natural desire may provide the beginning, at least, of an answer to Kant's objection to the ethics of happiness on the ground that its principles lack universality or the element of obligation. The natural moral law may command obedience at the same time that it directs men to happiness as the satisfaction of all desires which represent the innate tendencies of man's nature. The theory of natural desire thus also has a bearing on the issue whether the content of happiness must really be the same for all men, regardless of how it may appear to them.

Even if men do not identify happiness with one type of good, but see it as the possession of every sort of good, can there be a reasonable difference of opinion concerning the types of good which must be included or the order in which these several goods should be sought? A negative answer seems to be required by the view that real as opposed to apparent goods are the objects of natural desire.

Aquinas, for example, admits that "*happy is the man who has all he desires, or whose every wish is fulfilled*, is a good and adequate definition" only "if it be understood in a certain way." It is "an inadequate definition if understood in another. For if we understand it simply of all that man desires by his natural appetite, then it is true that he who has all that he desires

is happy; since nothing satisfies man's natural desire, except the perfect good which is Happiness. But if we understand it of those things that man desires according to the apprehension of reason," Aquinas continues, then "it does not belong to Happiness to have certain things that man desires; rather does it belong to unhappiness, in so far as the possession of such things hinders a man from having all that he desires naturally." For this reason, Aquinas points out, when Augustine approved the statement that "*happy is he who has all he desires*," he added the words "provided he *desires nothing amiss*."

As men have the same complex nature, so they have the same set of natural desires. As they have the same natural desires, so the real goods which can fulfill their needs comprise the same variety for all. As different natural desires represent different parts of human nature—lower and higher—so the several kinds of good are not equally good. And, according to Aquinas, if the natural object of the human will "is the universal good," it follows that "naught can satisfy man's will save the universal good." This, he holds, "is to be found, not in any created thing, but in God alone."

We shall return later to the theologian's conception of perfect happiness as consisting in the vision of God in the life hereafter. The happiness of this earthly life (which the philosopher considers) may be imperfect by comparison, but such temporal felicity as men can attain is no less determined by natural desire. If a man's undue craving for one type of good can interfere with his possession of another sort of good, then the various goods must be ordered according to their worth; and this order, since it reflects natural desire, must be the same for all men. In such terms Aristotle seems to think it possible to argue that the reality of happiness can be defined by reference to human nature and that the rules for achieving happiness can have a certain universality—despite the fact that the rules must be applied by individuals differently to the circumstances of their own lives. No particular good should be sought excessively or out of proportion to others, for the penalty of having too much of one good thing is deprivation or disorder with respect to other goods.

THE RELATION OF happiness to particular goods raises a whole series of questions, each peculiar to the type of good under consideration. Of these, the most insistent problems concern pleasure, knowledge, virtue, and the goods of fortune.

With regard to pleasure, the difficulty seems to arise from two meanings of the term which are more fully discussed in the chapter on PLEASURE AND PAIN. In one of these meanings pleasure is an object of desire, and in the other it is the feeling of satisfaction which accompanies the possession of objects desired. It is in the latter meaning that pleasure can be identified with happiness or, at least, be regarded as its correlate, for if happiness consists in the possession of all good things it is also the sum total of attainable satisfactions or pleasures. Where pleasure means satisfaction, pain means frustration, not the sensed pain of injured flesh. Happiness, Locke can therefore say, "is the utmost pleasure we are capable of"; and Mill can define it as "an existence exempt as far as possible from pain, and as rich as possible in enjoyments." Nor does Aristotle object to saying that the happy life "is also in itself pleasant."

But unlike Locke and Mill, Aristotle raises the question whether all pleasures are good, and all pains evil. Sensuous pleasure as an object often conflicts with other objects of desire. And if "pleasure" means satisfaction, there can be conflict among pleasures, for the satisfaction of one desire may lead to the frustration of another. At this point Aristotle finds it necessary to introduce the principle of virtue. The virtuous man is one who finds pleasure "in the things that are by nature pleasant." The virtuous man takes pleasure *only* in the right things, and is willing to suffer pain for the right end. If pleasures, or desires and their satisfaction, can be better or worse, there must be a choice among them for the sake of happiness. Mill makes this choice depend on a discrimination between lower and higher pleasures, not on virtue. He regards virtue merely as one of the parts of happiness, in no way different from the others. But Aristotle seems to think that virtue is the principal means to happiness because it regulates the choices which must be rightly made in order to obtain all good things; hence his defi-

nition of happiness as "activity in accordance with virtue."

This definition raises difficulties of still another order. As the chapter on VIRTUE AND VICE indicates, there are for Aristotle two kinds of virtue, moral and intellectual, the one concerned with desire and social conduct, the other with thought and knowledge. There are also two modes of life, sometimes called the active and the contemplative, differing as a life devoted to political activity or practical tasks differs from a life occupied largely with theoretic problems in the pursuit of truth or in the consideration of what is known. Are there two kinds of happiness then, belonging respectively to the political and the speculative life? Is one a better kind of happiness than another? Does the practical sort of happiness require intellectual as well as moral virtue? Does the speculative sort require both also?

In trying to answer these questions, and generally in shaping his definition of happiness, Aristotle considers the role of the goods of fortune, such things as health, wealth, auspicious birth, native endowments of body or mind, and length of life. These gifts condition virtuous activity or may present problems which virtue is needed to solve. But to the extent that having or not having them is a matter of fortune, they are not within a man's control—to get, keep, or give up. If they are indispensable, happiness is precarious, or even unattainable by those who are unfortunate. In addition, if the goods of fortune are indispensable, the definition of happiness must itself be qualified. More is required for happiness than activity in accordance with virtue.

"Should we not say," Aristotle asks, "that he is happy who is active in accordance with complete virtue and is sufficiently equipped with external goods, not for some chance period but throughout a complete life? Or must we add 'and who is destined to live thus and die as befits his life'? . . . If so, we shall call happy those among living men in whom these conditions are, and are to be, fulfilled—but happy *men*."

THE CONSIDERATION of the goods of fortune has led to diverse views about the attainability of happiness in this life. For one thing, they may

act as an obstacle to happiness. Pierre Bezùkhov in *War and Peace* learned, during his period of captivity, that "man is created for happiness; that happiness lies in himself, in the satisfaction of his natural human cravings; that all unhappiness arises not from privation but from superfluity."

The vicissitudes of fortune seem to be what Solon has in mind when, as reported by Herodotus, he tells Croesus, the king of Lydia, that he will not call him happy "until I hear that thou has closed thy life happily . . . for oftentimes God gives men a gleam of happiness, and then plunges them into ruin." For this reason, in judging of happiness, as "in every matter, it behoves us to mark well the end."

Even if it is possible to call a man happy while he is alive—on the ground that virtue, which is within his power, may be able to withstand anything but the most outrageous fortune—it is still necessary to define happiness by reference to a complete life. Children cannot be called happy, Aristotle holds, because their characters have not yet matured and their lives are still too far from completion. To call them happy, or to call happy men of any age who still may suffer great misfortune, is merely to voice the hopes we have for them. "The most prosperous," Aristotle writes, "may fall into great misfortunes in old age, as is told of Priam in the Trojan cycle; and one who has experienced such chances and has ended wretchedly no one calls happy."

Among the goods of fortune which seem to have a bearing on the attainment of happiness, those which constitute the *individual* nature of a human being at birth—physical traits, temperament, degree of intelligence—may be unalterable in the course of life. If certain inherited conditions either limit the capacity for happiness or make it completely unattainable, then happiness, which is defined as the end of man, is not the *summum bonum* for all, or not for all in the same way.

In the Aristotelian view, for example, women cannot be happy to the same degree or in the same manner as men; and natural slaves, like beasts, have no capacity for happiness at all, though they may participate in the happiness of the masters they serve. The theory is that through serving him, the slave gives the master

the leisure necessary for the political or speculative life open to those of auspicious birth. Even as the man who is a slave belongs wholly to another man, so the highest good of his life lies in his contribution to the happiness of that other.

The question whether happiness can be achieved by all normal human beings or only by those gifted with very special talents, depends for its answer in part on the conception of happiness itself. Like Aristotle, Spinoza places happiness in intellectual activity of so high an order that the happy man is almost godlike; and, at the very end of his *Ethics*, he finds it necessary to say that the way to happiness "must indeed be difficult since it is so seldom discovered." Nevertheless, "true peace of soul" can be found by the rare individual. "All noble things are as difficult as they are rare." In contrast, a statement like Tawney's—that "if a man has important work to do, and enough leisure and income to enable him to do it properly, he is in possession of as much happiness as is good for any of the children of Adam"—seems to make happiness available to more than the gifted few.

Whether happiness is attainable by all men, even on Tawney's definition, may also depend on the economic system and the political constitution, to the extent that they determine whether all men will be granted the opportunity and the leisure to use whatever talents they have for leading a decent human life. There seems to be a profound connection between conceiving happiness in such a way that all normal men are capable of it and insisting that all normal men deserve political status and economic liberty. Mill, for example, differs from Aristotle on both scores.

DIFFERING FROM the position of both Aristotle and Mill is the view that happiness is an illusory goal—that the besetting ills of human life as well as the frailty of men lead inevitably to tragedy. The great tragic poems and the great tragedies of history may, of course, be read as if they dealt with the exceptional case, but another interpretation is possible. Here writ large in the life of the hero, the great or famous man, is the tragic pattern of human life which is the lot of all men.

Sophocles seems to be saying this, when he writes in *Oedipus at Colonus*: "Not to be born is, past all prizing, best; but, when a man hath seen the light, this is next best by far, that with all speed he should go thither, whence he hath come. For when he hath seen youth go by, with its light follies, what troublous affliction is strange to his lot, what suffering is not therein?—envy, factions, strife, battles, and slaughters; and, last of all, age claims him for her own—age, dispraised, infirm, unsociable, unfriended, with whom all woe of woe abides."

Death is sometimes regarded as the symbol of tragic frustration. Sometimes it is not death, but the fear of death which overshadows life, so that for Montaigne, learning how to face death well seems indispensable to living well. "The very felicity of life itself," he writes, "which depends upon the tranquility and contentment of a well-descended spirit, and the resolution and assurance of a well-ordered soul, ought never to be attributed to any man till he has first been seen to play the last, and, doubtless, the hardest act of his part. There may be disguise and dissimulation in all the rest . . . but, in this scene of death, there is no more counterfeiting: we must speak out plain and discover what there is of good and clean in the bottom of the pot."

So, too, for Lucretius, what happiness men can have depends on their being rid of the fear of death through knowing the causes of things. But neither death nor the fear of death may be the crucial flaw. It may be the temporal character of life itself.

It is said that happiness consists in the possession of all good things. It is said that happiness is the quality of a whole life, not the feeling of satisfaction for a moment. If this is so, then Solon's remark to Croesus can be given another meaning, namely, that happiness is not something actually enjoyed by a man at any moment of his life. Man can come to possess all good things only in the succession of his days, not simultaneously; and so happiness is never actually achieved but is always in the process of being achieved. When that process is completed, the man is dead, his life is done.

It may still be true that to live well or virtuously—with the help of fortune—is to live happily, but so long as life goes on, happiness is

pursued rather than enjoyed. On earth and in time, man does not seem able to come to rest in any final satisfaction, with all his desires quieted at once and forever by that vision of perfection which would deserve Faust's "Stay, thou art so fair!"

AS ALREADY INTIMATED, the problem of human happiness takes on another dimension when it is treated by the Christian theologians. Any happiness which men can have on earth and in time is, according to Augustine, "rather the solace of our misery than the positive enjoyment of felicity.

"Our very righteousness," he goes on to say, "though true in so far as it has respect to the true good, is yet in this life of such a kind that it consists rather in the remission of sins than in the perfecting of virtues. . . . For as reason, though subjected to God, is yet 'pressed down by the corruptible body,' so long as it is in this mortal condition, it has not perfect authority over vice. . . . For though it exercises authority, the vices do not submit without a struggle. For however well one maintains the conflict, and however thoroughly he has subdued these enemies, there steals in some evil thing, which, if it do not find ready expression in act, slips out by the lips, or insinuates itself into the thought; and therefore his peace is not full so long as he is at war with his vices."

Accepting the definition of happiness as the possession of all good things and the satisfaction of all desires, the theologians compare the successive accumulation of finite goods with the unchanging enjoyment of an infinite good. An endless prolongation of the days of our mortal life would not increase the chances of becoming perfectly happy, because time and change permit no rest, no finality. Earthly happiness is therefore intrinsically imperfect.

Perfect happiness belongs to the eternal life of the immortal soul, completely at rest in the beatific vision, for in the vision of God the soul is united to the infinite good by knowledge and love. In the divine presence and glory all the natural desires of the human spirit are simultaneously satisfied—the intellect's search for truth and the will's yearning for the good. "That final peace to which all our righteousness has reference, and for the sake of which it is

maintained," Augustine describes as "the felicity of a life which is done with bondage"—to vice or conflict, to time and change. In contrast, the best human life on earth is miserable with frustrations and an ennui that human nature cannot escape.

The doctrine of immortality is obviously presupposed in the theological consideration of happiness. For Kant immortality is a necessary condition of the soul's infinite progress toward the moral perfection, the holiness, which alone deserves perfect happiness. But for theologians like Augustine and Aquinas, neither change nor progress play any part in immortal life. On the contrary, the immortal soul finds its salvation in eternal rest. The difference between motion and rest, between time and eternity, belongs to the very essence of the theologian's distinction between imperfect happiness on earth and perfect happiness hereafter.

These matters, of relevance to the theory of happiness, are discussed in the chapters on ETERNITY and IMMORTALITY; and in the chapter on SIN we find another religious dogma, that of original sin, which has an obvious bearing on earthly happiness as well as on eternal salvation. Fallen human nature, according to Christian teaching, is incompetent to achieve even the natural end of imperfect temporal happiness without God's help. Milton expounds this doctrine of indispensable grace in *Paradise Lost*, in words which God the Father addresses to His Son:

Man shall not quite be lost, but sav'd who will,
Yet not of will in him, but grace in me
Freely voutsaft; once more I will renew
His lapsed powers, though forfeit and enthralld
By sin to foul exorbitant desires;
Upheld by me, yet once more he shall stand
On even ground against his mortal foe,
By me upheld, that he may know how frail
His fall'n condition is, and to me owe
All his deliv'rance, and to none but me.

God's grace is needed for men to lead a good life on earth as well as for eternal blessedness. On earth, man's efforts to be virtuous require the reinforcement of supernatural gifts—faith, hope, and charity, and the infused moral virtues. The beatific vision in Heaven totally exceeds the natural powers of the soul and comes with the gift of added supernatural light. It seems, in short, that there is no purely natural

happiness according to the strict tenets of Christian doctrine.

Aquinas employs the conception of eternal beatitude not only to measure the imperfection of earthly life, but also to insist that temporal happiness is happiness at all only to the extent that it is a remote participation of true and perfect happiness. It cannot be said of temporal happiness that it "excludes every evil and fulfills every desire. In this life every evil cannot be excluded. For this present life is subject to many unavoidable evils: to ignorance on the part of the intellect; to inordinate affection on the part of the appetite; and to many penalties on the part of the body. . . . Likewise," Aquinas continues, "neither can the desire for good be satiated in this life. For man naturally desires the good which he has to be abiding. Now the goods of the present life pass away, since life itself passes away. . . . Wherefore it is impossible to have true happiness in this life."

If perfect happiness consists in "the vision of the Divine Essence, which men cannot obtain in this life," then, according to Aquinas, only the earthly life which somehow partakes of God has a measure of happiness in it. Earthly happiness, imperfect because of its temporal and bodily conditions, consists in a life devoted to God—a kind of inchoate participation here and now of the beatific vision hereafter. On earth there can be only a beginning "in respect of that operation whereby man is united to God. . . . In the present life, in as far as we fall short of the unity and continuity of that operation, so do we fall short of perfect happiness. Nevertheless it is a participation of happiness; and so much the greater, as the operation can be more continuous and more one. Consequently the active life which is busy with many things, has less of happiness than the contemplative life, which is busied with one thing, *i.e.*, the contemplation of truth."

When the theologians consider the modes of life on earth in terms of the fundamental distinction between the secular and the religious, or the active and the contemplative, they seem to admit the possibility of imperfect happiness in either mode. In either, a devout Christian dedicates every act to the glory of God, and through such dedication embraces the divine in the passing moments of his earthly pilgrimage

OUTLINE OF TOPICS

	PAGE
1. The desire for happiness: its naturalness and universality	695
2. The understanding of happiness: definitions and myths	696
2a. The marks of a happy man, the quality of a happy life	
2b. The content of a happy life: the parts or constituents of happiness	697
(1) The contribution of the goods of fortune to happiness: wealth, health, longevity	
(2) Pleasure and happiness	698
(3) Virtue in relation to happiness	699
(4) The role of honor in happiness	
(5) The importance of friendship and love for happiness	700
(6) The effect of political power or status on happiness	701
(7) The function of knowledge and wisdom in the happy life: the place of speculative activity and contemplation	
3. The argument concerning happiness as a first principle of morality: the conflicting claims of duty and happiness	702
4. The pursuit of happiness	
4a. Man's capacity for happiness: differences in human nature with respect to happiness	703
4b. The attainability of happiness: the fear of death and the tragic view of human life	
5. The social aspects of happiness: the doctrine of the common good	704
5a. The happiness of the individual in relation to the happiness or good of other men	705
5b. The happiness of the individual in relation to the welfare of the state: happiness in relation to government and diverse forms of government	
6. The happiness of men in relation to the gods or the after-life	706
7. The distinction between temporal and eternal happiness	
7a. The effects of original sin: the indispensability of divine grace for the attainment of natural happiness	707
7b. The imperfection of temporal happiness: its failure to satisfy natural desire	
7c. Eternal beatitude: the perfection of human happiness	
(1) The beatific vision	708
(2) The joy of the blessed: the communion of saints	
(3) The misery of the damned	709
7d. The beatitude of God	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 34: HISTORY

INTRODUCTION

IN our language the term *History*," Hegel observes, "unites the objective with the subjective side. . . . It comprehends not less what has *happened* than the *narration* of what has happened. This union of the two meanings we must regard as of a higher order than mere outward accident; we must suppose historical narrations to have appeared contemporaneously with historical deeds and events."

Our daily speech confirms Hegel's observation that "history" refers to that which has happened as well as to the record of it. We speak of the history of a people or a nation, or of the great events and epochs of history; and we also call a history the book which gives a narrative account of these matters.

It is as if we used the word "physics" to name both the object of study and the science of that object; whereas normally we tend to use "physics" for the science and refer to its subject matter as the physical world. We do not say that matter in motion is physics, but that it is the object of physics, one of the things a physicist studies. We might similarly have adopted the convention of using "history" in a restricted sense to signify a kind of knowledge or a kind of writing, and then called the phenomena written about or studied "historical" but not "history."

That, however, is not the prevailing usage. The word "history" seems to have at least four distinct meanings. It refers to a kind of knowledge. It refers to a type of literature. It means an actual sequence of events in time, which constitutes a process of irreversible change. This can be *either* change in the structure of the world or any part of nature, *or* change in human affairs, in society or civilization.

Historical knowledge and historical writing can be about natural history or human history. In his classification of the kinds of knowledge,

Francis Bacon makes this distinction when he divides history into "natural, civil, ecclesiastical, and literary." Whereas the last three deal with human things, the first is concerned with the non-human part of the natural world. At the same time, this natural history is not, in Bacon's judgment, the same thing as "natural philosophy," or what we would now call "natural science."

In this set of great books, natural history, even cosmic history, makes its appearance in works which we ordinarily classify as science or philosophy; for example, Darwin's *Origin of Species*, Lucretius' *On the Nature of Things*, or Plato's *Timaeus*. The great books of history deal with man and society, not nature or the universe. For the most part this is true also of the great philosophies of history. They, too, are primarily concerned with human civilization, not the physical world.

IN ITS ORIGINAL Greek root, the word "history" means research, and implies the act of judging the evidences in order to separate fact from fiction. The opening line of Herodotus is sometimes translated not "these are the histories of Herodotus of Halicarnassus," but "these are the researches . . ."

The word "research" can, of course, mean any sort of inquiry—into what is the case as well as into what has happened. The title of one of Aristotle's biological works, the *History of Animals*, suggests that it is concerned with researches about animals. The book does not deal with natural history; it is not a history of animals in the sense of giving the stages of their development in the course of time. The redundancy of "historical research" can therefore be excused on the ground that it is necessary to distinguish between two kinds of inquiry or research—scientific and historical.

Originally, research set the historian apart from the poet and the maker of myths or legends. They told stories, too; but only the historian restricted himself to telling a story based on the facts ascertained by inquiry or research. Herodotus deserves the title "father of history" for having originated a style of writing which differs from poetry in this extraordinary respect. He tries to win the reader's belief not by the plausibility of his narrative, but rather by giving the reader some indication of the sources of information and the reliability of the evidence on which the narrative is based.

The poet tries to tell a likely story, but the historian tries to make credible statements about particular past events. He makes an explicit effort to weigh the evidence himself or, as Herodotus so frequently does, to submit conflicting testimony to the reader's own judgment. "Such is the account which the Persians give of these matters," he writes, "but the Phoenicians vary from the Persian statements"; or "this much I know from information given me by the Delphians; the remainder of the story the Milesians add"; or "that these were the real facts I learnt at Memphis from the priests of Vulcan"; or "such is the truth of this matter; I have also heard another account which I do not at all believe"; or again, "thus far I have spoken of Egypt from my own observation, relating what I myself saw, the ideas that I formed, and the results of my own researches. What follows rests on accounts given me by the Egyptians, which I shall now repeat, adding thereto some particulars which fell under my own notice."

Herodotus seems quite conscious of the difference between himself and Homer, especially on those matters treated by the poet which fall within his purview as an historian. The Trojan War lies in the background of the conflict with which Herodotus is directly concerned—the Persian invasion of Greece—for the Persians "trace to the attack upon Troy their ancient enmity towards the Greeks."

Herodotus does not doubt that the siege of Troy took place as Homer relates, but he learns from the Egyptians a legend about the landing of Paris and Helen on Egyptian soil and the detention of Helen by Proteus, king of Memphis. "Such is the tale told me by the priests con-

cerning the arrival of Helen at the court of Proteus. It seems to me that Homer was acquainted with this story, and while discarding it, because he thought it less adapted for epic poetry than the version which he followed, showed that it was not unknown to him."

Herodotus cites passages in the *Iliad* and the *Odyssey* to corroborate this point. He is willing to use the Homeric poems as one source of information, but not without checking them against conflicting accounts. "I made inquiry," he writes, "whether the story which the Greeks tell about Troy is a fable or not." When he comes to the conclusion that Helen was never within the walls of the city to which the Greeks laid siege for ten years, he tells the reader his reasons for thinking so. Homer, however, when he narrates Helen's actions during the siege, does not bother to establish the facts of the matter or to give the reader contrary versions of what took place. That is not the poet's task, as Herodotus recognizes. It belongs to the historian, not the poet. The story which may have greater probability in fact may not be the better story for the poet.

SINCE HE IS BOTH an investigator and a storyteller, the historian stands comparison with the scientist in one respect and with the poet in another. The special character of history as a kind of knowledge distinct from science or philosophy seems clear from its object—the singular or unique events of the past. The scientist or philosopher is not concerned with what has happened, but with the nature of things. Particular events may serve as evidences for him, but his conclusions go beyond statements of particular fact to generalizations about the way things are or happen at any time and place. In contrast, the historian's research begins and ends with particulars. He uses particulars directly observed by himself or testified to by others as the basis for circumstantial inference to matters which cannot be established by direct evidence. The method of investigation developed by the early historians may be the precursor of scientific method, but the kind of evidence and the mode of argument which we find in Hippocrates or Plato indicate the divergence of the scientist and philosopher from the procedure of the historian.

The contrast between history and science—or what for the purpose of comparison may be the same, philosophy—is formulated in Aristotle's statement concerning poetry, that it is "more philosophical than history, because poetry tends to express the universal, history the particular." History deals with what has actually happened, whereas poetry, like philosophy, may be concerned with whatever is or can be.

One comparison leads to another. Unlike poetry, history and science are alike in that they both attempt to prove what they say. But in distinction from science or philosophy, history resembles poetry, especially the great epic and dramatic poems, in being narrative literature. The historian and the poet both tell stories.

If the poet and the historian—including, of course, a biographer like Plutarch—are also moralists, they are moralists in the same way. Their works do not contain expositions of ethical or political doctrine, but rather concrete exemplifications of theories concerning the conduct of human life and social practices. That fact explains why much of the content of the great historical books is cited in other chapters dealing with moral and political, even psychological, topics. But in this chapter we are concerned with history itself rather than with the particulars of history. We are concerned with the methods and aims of history as a kind of knowledge and literature; and we are concerned with the historical process as a whole, the consideration of which belongs to the philosophy of history.

THE AIMS AND methods of writing history are discussed by the historian himself, as well as by the philosopher. Philosophers like Hobbes, Bacon, or Descartes consider history largely from the point of view of the kind of knowledge it is and the contribution it makes to the whole of human learning. Historians like Herodotus, Thucydides, Tacitus, and Gibbon state more specifically the objectives of their work, the standards of reliability or authenticity by which they determine what is fact, and the principles of interpretation by which they select the most important facts, ordering them according to some hypothesis concerning the meaning of the events reported.

Herodotus writes, he tells us, "in the hope of preserving from decay the remembrance of what men have done, and of preventing the great and wonderful actions of the Greeks and the barbarians from losing their due meed of glory." Thucydides proceeds in the belief that the war between the Peloponnesians and the Athenians "was the greatest movement yet known in history, not only of the Hellenes, but of a large part of the barbarian world—I had almost said of mankind." Not very different is the declaration of Tacitus: "My purpose is not to relate at length every motion, but only such as were conspicuous for excellence or notorious for infamy. This I regard as history's highest function, to let no worthy action be uncommemorated, and to hold out the reprobation of posterity as a terror to evil words and deeds."

But though there seems to be a striking similarity in the purpose of these historians, Tacitus alone of the three avows a moral purpose. Furthermore, each of the three is conscious of the individual way in which he has put his intention into effect. Thucydides, for example, seems to have Herodotus in mind when he fears that "the absence of romance in my history will detract somewhat from its interest; but if it be judged useful by those inquirers who desire an exact knowledge of the past. . . I shall be content." Like Thucydides, Tacitus is an historian of contemporary events and he fears comparison with the historian of antiquity who can "enchain and refresh a reader's mind" with "descriptions of countries, the various incidents of battle, glorious deaths of great generals." His own work may be instructive, he thinks, but it may also give very little pleasure because he has "to present in succession the merciless bidings of a tyrant, incessant prosecutions, faithless friendships, the ruin of innocence, the same causes issuing in the same results, and [he is] everywhere confronted with a wearisome monotony in [his] subject-matter."

As we have already noted, Herodotus seems satisfied to let the reader decide between conflicting accounts. Only occasionally does he indicate which is more likely in his own judgment. Thucydides claims that he has made a greater effort to determine the facts. "I did not even trust my own impressions," he writes; the narrative "rests partly on what I saw myself, partly

on what others saw for me, the accuracy of the report being always tried by the most severe and detailed tests possible. My conclusions have cost me some labor from the want of coincidence between the accounts of the same occurrences by different eye-witnesses." But he thinks that his conclusions "may safely be relied on," undisturbed "either by the lays of a poet displaying the exaggeration of his craft, or by the compositions of the chroniclers which are attractive at truth's expense."

The historians are aware of the difficulty of combining truth-telling with storytelling. Most men, Thucydides remarks, are unwilling to take enough pains "in the investigation of truth, accepting readily the first story that comes to hand." The difficulty, according to Tacitus, is the obscurity of the greatest events, "so that some take for granted any hearsay, whatever its source, others turn truth into falsehood, and both errors find encouragement with posterity."

Reviewing the enormous scope of his work, Gibbon at the very end concludes that "the historian may applaud the importance and variety of his subject; but, while he is conscious of his own imperfections, he must often accuse the deficiency of his materials." Because of the scarcity of authentic memorials, he tells us in another place, the historian finds it hard "to preserve a clear and unbroken thread of narration. Surrounded with imperfect fragments, always concise, often obscure, and sometimes contradictory, he is reduced to collect, to compare, and to conjecture; and though he ought never to place his conjectures in the rank of facts, yet the knowledge of human nature, and of the sure operation of its fierce and unrestrained passions, might, on some occasions, supply the want of historical materials."

Clearly, the historians have different criteria of relevance in determining the selection and rejection of materials and different principles of interpretation in assigning the causes which explain what happened. These differences are reflected in the way each historian constructs from the facts a grand story, conceives the line of its plot and the characterization of its chief actors. Herodotus, for example, has been compared with Homer as writing in an epic manner; Thucydides, with the dramatic writers of

tragedy. Even if they all agreed on the ascertainment of fact, the great historians would differ from one another as the great poets do; each has a style and a vision as personal and poetic as Homer or Virgil, Melville or Tolstoy.

ONLY ONE OF THE great books is, by title and design, devoted entirely to the philosophy of history—to the formulation of a theory which embraces the whole of man's career on earth. This is Hegel's *Philosophy of History*. Augustine's *City of God* presents an equally comprehensive vision, but a comparison of the two suggests that they differ from one another as philosophy from theology.

The point of this comparison is not that God and His providence are omitted from the philosopher's view. On the contrary, Hegel regards the history of the world as a "process of development and the realization of Spirit—this is the true theodicy, the justification of God in History. Only this insight can reconcile Spirit with the History of the World—viz., that what has happened and is happening every day is not only not 'without God' but is essentially His Work."

The difference is rather to be found in the ultimate source of insight concerning human development and destiny. Augustine sees everything in the light of God's revelation of His plan in Holy Writ; Hegel and other philosophers of history from Vico to Toynbee seek and sometimes claim to find in the records of history itself the laws which govern and the pattern which inheres in the procession of events from the beginning to the end of human time.

For Augustine, the great epochs of history are defined religiously. They are stages in the development of the city of God on earth, not the city of man. Man is viewed as dwelling on earth under four distinct dispensations from God: (1) in Paradise before the Fall; (2) in the world after expulsion from Eden and before the Promise and the Law were given to the Jews; (3) under the Law and before the coming of Christ; (4) between the first and second coming under the dispensation of grace.

Augustine sometimes makes other divisions of history, but they are always primarily religious. For example, he divides all of time into

seven ages, corresponding to the seven days of creation. "The first age, as the first day, extends from Adam to the deluge; the second from the deluge to Abraham. . . . From Abraham to the advent of Christ there are, as the evangelist Matthew calculates, three periods, in each of which are fourteen generations—one period from Abraham to David, a second from David to the captivity, a third from the captivity to the birth of Christ in the flesh. There are thus five ages in all. The sixth is now passing, and cannot be measured by any number of generations. . . . After this period God shall rest as on the seventh day, when He shall give us (who shall be the seventh day) rest in Himself. . . . The seventh shall be our Sabbath, which shall be brought to a close, not by an evening, but by the Lord's day, as an eighth and eternal day, consecrated by the resurrection of Christ, and prefiguring the eternal repose not only of the spirit, but also of the body . . . This is what shall be in the end without end."

This same projection of history—in all essentials, at least—is laid before Adam by the archangel Michael in Milton's *Paradise Lost*, just before Adam leaves the Garden of Eden.

Unlike the four major dispensations of which Augustine and Milton speak, Hegel's four stages of the world are epochs in the development of Spirit as manifested in the State. They are secularly defined as the Oriental, the Greek, the Roman, and the German world and are seen as a "progress of the consciousness of Freedom." The "various grades in the consciousness of Freedom," Hegel writes, "supply us with the natural division of universal History. . . . The Orientals have not attained the knowledge that Spirit—Man *as such*—is free; and because they do not know this, they are not free. They only know that *one is free* . . . that *one* is therefore only a Despot; not a *free man*. The consciousness of Freedom first arose among the Greeks, and therefore they were free; but they, and the Romans likewise, knew only that *some* are free—not man as such. . . . The Greeks, therefore, had slaves and their whole life and the maintenance of their splendid liberty, was implicated with the institution of slavery. . . . The German nations, under the influence of

Christianity, were the first to attain the consciousness that man, as man, is free."

With the complete emancipation of man in the German-Christian world, history is consummated for Hegel. "The grand principle of being is realized," he declares; "consequently the end of days is fully come." Another sign of the finality of the German-Christian world seems to be its reconciliation of Church and State: "European history is the exhibition of the growth of each of these principles severally . . . then of an antithesis on the part of both . . . lastly, of the harmonizing of the antithesis." In the German-Christian world, the secular and the religious modes of life are ultimately harmonized, fused in a single order of "rational Freedom."

APART FROM THE opposition between the philosophical and theological approaches, here represented by Hegel and Augustine, there seem to be two main issues in the general theory of human history. The first concerns the pattern of change; the second, the character of the causes at work.

The pattern most familiar because of its prevalence in modern speculations is that of progress or evolution. The progress may be conceived as a dialectical motion in the realm of Spirit, contrasted by Hegel with the realm of Matter or Nature, according as "the essence of Matter is Gravity . . . and the essence of Spirit is Freedom." But it may also be thought to occur, as in the dialectical materialism of Marx and Engels, through the resolution of conflicting material or economic forces.

"The whole history of mankind," Engels writes in his preface to the *Communist Manifesto*, "since the dissolution of primitive tribal society, holding land in common ownership, has been a history of class struggles, contests between exploiting and exploited, ruling and oppressed classes; the history of these class struggles forms a series of evolutions in which, now-a-days, a stage has been reached where the exploited and oppressed class, the proletariat, cannot attain its emancipation from the sway of the exploiting and ruling class, the bourgeoisie, without, at the same time, and once for all, emancipating society at large from all exploitation, oppression, class-distinction and

class-struggle." The four great economic systems—the systems of slave labor, feudal serfdom, industrial capitalism, and the communistic or classless society—are thus seen as the stages of progress toward an ultimate perfection in which history comes to rest because it has at last fully realized its controlling tendency.

The pattern of progress may be conceived not as a dialectical motion involving conflict and synthesis, but rather, as by Kant, in terms of an increasing actualization of the potentialities for good in human life. Giving the name of *culture* to "the production in a rational being of an aptitude for any ends whatever of his own choosing," Kant declares, "it is only culture that can be the ultimate end which we have cause to attribute to nature in respect of the human race." The progressive realization of culture consists in "the liberation of the will from the despotism of desires whereby, in our attachment to certain natural things, we are rendered incapable of exercising a choice of our own." In these terms history moves toward a perfection which can never be fully achieved on earth, for man's "own nature is not so constituted as to rest or be satisfied in any possession or enjoyment whatever."

As conceived by the evolutionist, progress may or may not attain its limit, but in either case its manifestation in human history appears to be analogous to as well as an extension of the line of development along which the world or all of living nature has gradually advanced.

THESE VIEWS ARE given further discussion in the chapters on EVOLUTION, PROGRESS, and WORLD. Whether or not the same pattern of change obtains in the historical order of nature as in the history of man and society, is a question to be answered by those who deny as well as by those who affirm progress. There is cyclical change in nature, the same pattern of birth, growth, decay, and death repeating itself generation after generation. That history too repeats itself with the rise and decline of cities and civilizations, seems to be the ancient view. It reappears in our day with Spengler and, somewhat qualified by the possibility of progress, with Toynbee.

"The cities which were formerly great," Herodotus observes, "have most of them be-

come insignificant; and such as are at present powerful were weak in olden time. I shall, therefore, discourse equally of both, convinced that prosperity never continues long in one stay." Lucretius finds the cyclical pattern both in the succession of worlds and in the succession of civilizations. The myth of the golden age of Kronos and the earth-bound age of Zeus, which Plato tells in the *Statesman*, also applies both to nature and society.

According to the myth, "there is a time when God himself guides and helps to roll the world in its course; and there is a time, on the completion of a certain cycle, when he lets go, and the world being a living creature, and having originally received intelligence from its author and creator, turns about and by an inherent necessity revolves in the opposite direction." Thus the history of the world runs through "infinite cycles of years," and one age succeeds another in an endless round.

There is still a third view which sees history as neither cyclical nor simply progressive. Virgil reverses the order of the Platonic myth by placing the golden age in the future. It dawns with Rome, where, in the words of the 4th *Eclogue*, "the majestic roll of circling centuries begins anew: Justice returns, returns old Saturn's reign, with a new breed of men sent down from heaven . . . and the iron shall cease, the golden race arise."

Rome for Virgil is not only the beginning of the golden age; it is also the consummation of history. In the *Aeneid* Jupiter himself declares that he has given the Romans "dominion without end"—that he has ordained for them "neither period nor boundary of empire." The "gowned race of Rome" shall be "the lords of the world"; then "war shall cease, and the iron ages soften." Thus, Jupiter says, "is it willed," and so "a day will come in the lapse of cycles." The perpetuity of Rome seems to leave little room for any further essential progress and no chance for another cycle of decay and regeneration.

The Christian dogma of the fall of man from grace and his return through divine mediation to grace and salvation seems to give history a pattern that is partly Platonic in the sequence which makes the loss of a golden age the occasion for striving to regain it. But it also seems

to be Virgilian in part. The epochal transitions of history happen only once. The coming of Christ is an absolutely singular event, after which there is no essential progress in man's condition until the Last Judgment at the end of the world.

COMMON TO THESE diverse conceptions of the pattern of history is the problem concerning the causes which are at work as history unfolds. Whatever the factors, they will operate in the future as they have in past, unless the millenium is already upon us or about to dawn. From the knowledge of their own past or from their dim perception of divine providence, men derive a sense of the future; but they look forward to that future differently according as some part of it will stem from choices freely made, or according as all of it is inexorably determined by causes beyond their control.

The basic alternatives of fate and freedom, of necessity and contingency, God's will and man's choice, are considered in the chapters on CHANCE, FATE, and NECESSITY AND CONTINGENCY. Sometimes the issue is resolved in the same way for the course of nature and the course of history: necessity reigns in both; as there is contingency in the events of nature, so there is freedom in the acts of history. Sometimes the processes of nature and history are distinguished: the motions of matter are governed by inviolable laws; whereas the motions of men are directed by laws which leave them free to work out a destiny which is determined by, rather than determines, the human spirit.

Those who do not deny freedom entirely in the realm of history seldom give it unlimited scope. What men can do is conditioned from below by the operation of material forces, and from above by what Hegel calls "God's purpose with the world." The vast "arras-web of Universal History" is woven by the interaction between God's will (the Absolute Idea) and human purposes or interests, which Hegel calls "the complex of human passions."

History for him is "the union of Freedom and Necessity," where "the latent abstract process of Spirit is regarded as Necessity, while that which exhibits itself in the conscious will of men, as their interest, belongs to the domain of freedom." But this freedom which coheres

with necessity seems to belong more to the human race as a whole than to individual men. The individual man is tossed aside if he tries to obstruct the path of history. He is powerless to change its course.

Not even great men can make or determine history. They are great only because, sensing the next phase of the historical process, they identify themselves with the wave of the future and conform their purposes to the march of events—the dialectical development of the Absolute Idea. A few men thus become "world-historical individuals" because their own "particular aims involve those large issues which are the will of the World-Spirit." They have "an insight into the requirements of the time—what was ripe for development . . . the very Truth for their age, for their world; the species next in order, so to speak, and which was already formed in the womb of time."

Like Hegel and unlike the ancient historians, Tolstoy also regards the leadership of great men as illusory. To believe in the efficacy of heroes or great men, he thinks, is to commit the fallacy of the man "who, watching the movements of a herd of cattle and paying no attention to the varying quality of the pasturage in different parts of the field, or to the driving of the herdsman, attributes the direction the herd takes to the animal which happens to be at its head."

Great men are only celebrated puppets, pushed ahead on the moving front of history. The motion of history derives its force and direction from the individual acts of the innumerable nameless men who comprise the human mass. The act of the individual counts little. The mass motion is a complex resultant of slight impulses tending in many directions. But however slight the impulse each man gives, his contribution to history is a free act, conditioned only by the circumstances under which he makes a choice and by the divine providence which grants him the freedom to choose. Like "every human action," history, according to Tolstoy, thus "appears to us as a certain combination of freedom and inevitability."

DIFFERENT FROM speculations on a grand scale concerning the whole historical process is that

type of philosophizing about history which considers its place in education—the light it affords to the mind, and the lessons it teaches for the guidance of conduct.

Montaigne, for example, makes the reading of history and biography the window through which a man looks out upon the world. "This great world," he writes, "is the mirror wherein we are to behold ourselves, to be able to know ourselves as we ought to do in the true bias." Only against the large scene history reveals and amidst the variety of human nature it exhibits can a man truly know himself and his own time. In a similar vein, Gibbon declares that "the experience of history exalts and enlarges the horizon of our intellectual view." Hegel, on the other hand, insists that "what experience and history teach is that peoples and governments never have learned anything from history, or acted on principles deduced from it.

On the practical side, political writers like Machiavelli, Montesquieu, and the Federalists use history to exemplify or confirm their generalizations. They agree with Thucydides that "an exact knowledge of the past is an aid to the interpretation of the future, which in the course of human things must resemble if it does not reflect it." Most men, adds Tacitus, "learn wisdom from the fortunes of others."

It is on these grounds that the great books of history belong with treatises on morals and politics and in the company of philosophical and theological speculations concerning the nature and destiny of man. Liberal education needs the particular as well as the universal, and these are combined in the great historical narratives. Apart from their utility, they have the originality of conception, the poetic quality, the imaginative scope which rank them with the great creations of the human mind.

OUTLINE OF TOPICS

	PAGE
1. History as knowledge and as literature: its kinds and divisions; its distinction from poetry, myth, philosophy, and science	719
2. The light and lesson of history: its role in the education of the mind and in the guidance of human conduct	720
3. The writing of history: research and narration	
3a. The determination and choice of fact: the classification of historical data	721
3b. The explanation or interpretation of historic fact: the historian's treatment of causes	
4. The philosophy of history	722
4a. Theories of causation in the historical process	
(1) The alternatives of fate or freedom, necessity or chance	
(2) Material forces in history: economic, physical, and geographic factors	723
(3) World history as the development of Spirit: the stages of the dialectic of history	
(4) The role of the individual in history: the great man, hero, or leader	
4b. The laws and patterns of historical change: cycles, progress, evolution	
4c. The spirit of the time as conditioning the politics and culture of a period	724
5. The theology of history	
5a. The relation of the gods or God to human history: the dispensations of providence	
5b. The city of God and the city of man; church and state	725

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. History as knowledge and as literature: its kinds and divisions; its distinction from poetry, myth, philosophy, and science

6 HERODOTUS: *History*, BK II, 71a-73b esp 72a-b; 75b; BK IV, 127a-b; BK VII, 242c-d

6 THUCYDIDES: *Peloponnesian War*, BK I, 354a-d

7 PLATO: *Cratylus*, 112b / *Republic*, BK II, 323d-324a / *Timaeus*, 447a / *Critias*, 479d / *Laws*, BK III 663d-677a

9 ARISTOTLE: *Poetics*, CH 9 [1451^a36^b32] 686a-c; CH 23 695a-c

14 PLUTARCH: *Theseus*, 1a-c / *Romulus* 15a-30a,c passim, esp 15a-18d / *Themistocles*, 102a,c / *Pericles*, 128d-129a / *Timoleon*, 195a-b / *Cimon*, 390b-d / *Alexander*, 540b,d-541a / *Dion*, 794c-795a

15 TACITUS: *Annals*, BK III, 60d; BK IV, 71d-72b; BK XI, 107c; BK XIII, 133b / *Histories*, BK II, 228a-b

18 AUGUSTINE: *Christian Doctrine*, BK II, CH 27-28 650a-d

23 HOBBS: *Leviathan*, PART I, 67b-c; 71c-d

25 MONTAIGNE: *Essays*, 24a-c; 41c-42a; 199a-200d; 305d-306a; 347c-350d; 457a-b

26 SHAKESPEARE: *Richard III*, ACT III, SC I [72-88] 123c-d / *Henry V*, PROLOGUE 532b,d

28 HARVEY: *On Animal Generation*, 473b

29 CERVANTES: *Don Quixote*, PART II, 213b-c

30 BACON: *Advancement of Learning*, 32d-39a esp 32d-33a, 38c-39a / *Novum Organum*, BK I, APH 87, 123b

31 DESCARTES: *Rules*, III, 3b-d / *Discourse*, PART I, 43a-b

33 PASCAL: *Pensées*, 628 287a / *Vacuum*, 355a-356a

35 LOCKE: *Human Understanding*, BK IV, CH XVI, SECT 7-11 368d-370a

35 HUME: *Human Understanding*, SECT VIII, DIV 65, 479b-c; SECT XII, DIV 132, 509c

37 FIELDING: *Tom Jones*, 19a-20a; 49b-50c

40 GIBBON: *Decline and Fall*, 88a-d; 97c-98d passim; 211a; 398b; 471c-d

41 GIBBON: *Decline and Fall*, 337c

44 BOSWELL: *Johnson*, 203a-b; 258d-259a; 353b-c

46 HEGEL: *Philosophy of Right*, INTRO, par 3, 10a-11c; PART III, par 355, 112d / *Philosophy of History*, INTRO, 153a-158a; 182d-183d; 193d-194a; PART I, 230c-231b; 248c; PART III, 285d-286a

51 TOLSTOY: *War and Peace*, BK X, 430d-431a; BK XI, 469a-470c; BK XIII, 563a-b; EPILOGUE II 675a-696d passim

53 JAMES: *Psychology*, 863b [fn 2]

2. The light and lesson of history: its role in the education of the mind and in the guidance of human conduct

- OLD TESTAMENT: *Deuteronomy*, 6:20-25; 7:6-11, 17-19; 8; 16:1-12; 29 / *Joshua*, 24:1-27—(D) *Josue*, 24:1-27 / *I Samuel*, 12:6-25—(D) *I Kings*, 12:6-25 / *Ezra*, 4:7-23—(D) *I Esdras*, 4:7-23 / *Nehemiah*, 9—(D) *II Esdras*, 9 / *Psalms*, 44:1-3; 78; 81; 105-106; 136 esp 136:10-24—(D) *Psalms*, 43:1-4; 77; 80; 104; 105; 135 esp 135:10-24 / *Ecclesiastes*, 1:11; 2:16 / *Isaiah*, 46:8-11—(D) *Isaias*, 46:8-11 / *Jeremiah*, 2:1-9—(D) *Jeremias*, 2:1-9 / *Ezekiel*, 20:1-44—(D) *Ezechiel*, 20:1-44
- APOCRYPHA: *Wisdom of Solomon*, 2:2-4—(D) OT, *Book of Wisdom*, 2:2-4
- NEW TESTAMENT: *II Peter*, 2 / *Jude*
- 4 HOMER: *Iliad*, BK IX [485-605] 62a-63b;
6 HERODOTUS: *History*, BK I, 2b; BK V, 175b; BK VIII, 273b-c; BK IX, 309d-310a
6 THUCYDIDES: *Peloponnesian War*, BK I, 354b-c; 379c-d
7 PLATO: *Timaeus*, 452b / *Statesman*, 587d / *Philebus*, 612a / *Laws*, BK III 663d-677a esp 667a-b; BK XII, 788a
8 ARISTOTLE: *Sophistical Refutations*, CH 34 [183^b16-184^b8] 253a-d / *Metaphysics*, BK I, CH 3-10 501c-511d esp CH 3 [983^b1-7] 501c-d, CH 10 511c-d; BK II, CH I [993^a30-^b19] 511b,d-512a; BK III 513b,d-522a,c passim, esp CH I [995^a23-^b4] 513b,d; BK XII, CH I [1060^a25-29] 598b; CH 8 [1074^b1-14] 604d-605a / *Soul*, BK I 631a-641d passim, esp CH 2 [403^b20-23] 633a
9 ARISTOTLE: *Ethics*, BK X, CH 9 [1181^b12-24] 436c / *Politics*, BK VII, CH 10 [1329^a40-^b35] 533d-534b / *Rhetoric*, BK I, CH 4 [1360^a30-37] 600d; BK II, CH 20 [1393^a25-^b3] 641a

Chapter 35: HONOR

INTRODUCTION

THE notions of honor and fame are sometimes used as if their meanings were interchangeable, and sometimes as if each had a distinct connotation. In the tradition of the great books, both usages will be found. It is seldom just a matter of words. The authors who see no difference between a man's honor and his fame are opposed on fundamental issues of morality to those who think the standards of honor are independent of the causes of fame. This opposition will usually extend to psychological issues concerning human motivation and to political issues concerning power and justice. It entails contrary views of the role of rewards and punishments in the life of the individual and of society.

Praise and blame seem to be common elements in the significance of fame and honor. The meaning of honor seems to involve in addition the notion of worth or dignity. But whether a man is virtuous or not, whether he *deserves* the good opinion of his fellow men, does not seem to be the indispensable condition on which his fame or infamy rests. Nor does his good or ill repute in the community necessarily signify that he is a man of honor or an honorable man.

The connection and distinction of these terms would therefore appear to be the initial problem of this chapter. Any solution of the problem must consider the relation of the individual to the community, and the standards by which the individual is appraised—by himself and his fellow men. Honor and fame both seem to imply public approval, but the question is whether both presuppose the same causes or the same occasions for social esteem.

"The manifestation of the value we set on one another," writes Hobbes, "is that which is commonly called Honoring and Dishonoring. To value a man at a high rate, is to *honor* him;

at a low rate, is to *dishonor* him. But high and low, in this case, is to be understood by comparison to the rate that each man setteth on himself." Does Hobbes mean that the value a man sets on himself is the true standard of his worth? Apparently not. Let men, he says, "rate themselves at the highest value they can; yet their true value is no more than it is esteemed by others." What, then, is the measure of such esteem? "The *value*, or worth of a man," answers Hobbes, "is as of all other things, his price; that is to say, so much as would be given for the use of his power; and therefore, is not absolute but a thing dependent on the need and judgment of another."

Here, then, honor is not what a man has in himself, but what he receives from others. Honor is paid him. He may think himself dishonored if others do not pay him the respect which accords with his self-respect, but their evaluation of him is somehow independent of the standard by which he measures himself. It depends on the relation in which he stands to them, in terms of his power and their need. Virtue and duty—considerations of good and evil, right and wrong—do not enter into this conception of honor. The distinction between honor and fame tends to disappear when honor reflects the opinion of the community, based on the political utility rather than the moral worth of a man.

THERE IS ANOTHER conception of honor which not only separates it from fame, but also makes it independent of public approbation. This is not an unfamiliar meaning of the term. The man who says "on my honor" or "my word of honor" may not be an honest man, but if he is, he pledges himself by these expressions to fulfill a promise or to live up to certain expectations. He is saying that he needs no ex-

ternal check or sanction. A man who had to be compelled by threat or force to honor his obligations would not be acting from a sense of honor.

"It is not for outward show that the soul is to play its part," Montaigne writes, "but for ourselves within, where no eyes can pierce but our own; there she defends us from the fear of death, of pain, of shame itself; there she arms us against the loss of our children, friends, and fortunes; and when opportunity presents itself, she leads us on to the hazards of war: 'Not for any profit, but for the honor of honesty itself.'"

A sense of honor thus seems to function like a sense of duty. Both reflect the light of conscience. Both operate through an inner determination of the will to do what reason judges to be right in the particular case. If there is a difference between them, it is not so much in their effects as in their causes.

Duty usually involves obligations to others, but a man's sense of honor may lead him to act in a certain way though the good of no other is involved. To maintain his self-respect he must respect a standard of conduct which he has set for himself. Accordingly, a man can be ashamed of himself for doing or thinking what neither injures anyone else nor ever comes to the notice of others. A sense of shame—the reflex of his sense of honor—torments him for having fallen short of his own ideal, for being disloyal to his own conceptions of what is good or right; and his shame may be even more intense in proportion as the standard he has violated is not one shared by others, but is his own measure of what a man should be or do.

Dmitri Karamazov exhibits these mixed feelings of honor and shame when he declares at the preliminary legal investigation: "You have to deal with a man of honor, a man of the highest honor; above all—don't lose sight of it—a man who's done a lot of nasty things, but has always been, and still is, honorable at bottom, in his inner being. . . . That's just what's made me wretched all my life, that I yearned to be honorable, that I was, so to say, a martyr to a sense of honor, seeking for it with a lantern, with the lantern of Diogenes, and yet all my life I've been doing filthy things."

The sense of honor and the sense of duty differ in still another respect. Duty presupposes law. The essence of law is its universality. A sense of duty, therefore, leads a man to do what is expected of him, but not of him alone, for he is no different from others in relation to what the law commands. In contrast, a sense of honor presupposes *self-consciousness* of virtue in the individual. It binds him in conscience to live up to the image of his own character, insofar as it has lineaments which seem admirable to him.

Without some self-respect, a man can have no sense of honor. In the great tragic poems, the hero who dishonors himself in his own eyes dies spiritually with the loss of his self-respect. To live on in the flesh thereafter would be almost a worse fate than the physical demise which usually symbolizes the tragic ending.

THE SENSE IN WHICH a man can honor or dishonor himself is closely akin to the sense in which he can be honored or dishonored by others. Both involve a recognition of virtue or its violation. But they differ in this: that a man's personal honor is an internal consequence of virtue and inseparable from it, whereas public honor bestowed upon a man is an external reward of virtue. It is not always won by those who deserve it. When it is, "it is given to a man," as Aquinas points out, "on account of some excellence in him, and is a sign and testimony of the excellence that is in the person honored."

There can be no separation between what a community considers honorable and what it considers virtuous or excellent in mind or character. But it does not necessarily follow that the man who is actually virtuous will always receive the honor which is due him. Public honor can be misplaced—either undeservedly given or unjustly withheld. The virtuous should be prepared for this, in the judgment of Aquinas, since honor is not "the reward for which the virtuous work, but they receive honor from men by way of reward, *as from those who have nothing greater to offer.*" Happiness, he goes on to say, is the "true reward . . . for which the virtuous work; for if they worked for honor, it would no longer be virtue, but ambition."

Tolstoy, however, deplors the injustice of the honor given Napoleon and the dishonor in which Kutuzov was held. "Napoleon," he writes, "that most insignificant tool of history who never anywhere, even in exile, showed human dignity—Napoleon is the object of adulation and enthusiasm; he is *grand*. But Kutuzov—the man who from the beginning to the end of his activity in 1812, never once swerving by word or deed from Borodino to Vilna, presented an example exceptional in history of self-sacrifice and a present consciousness of the future importance of what was happening—Kutuzov seems to them something indefinite and pitiful, and when speaking of him and of the year 1812 they always seem a little ashamed."

Kutuzov later received some measure of honor when he was presented with the rarely awarded Order of St. George. But what is perhaps a much higher honor came to him after his death when Tolstoy enshrined him as one of the heroes of *War and Peace*. Sometimes the virtuous or truly honorable man, living in a bad society, goes without honor in his own time to be honored only by posterity. He may even be dishonored by a society which has contempt for virtue. Sometimes a man of indifferent character and achievement, or even one who is actually base and ignoble, wins honor through cleverly simulating the possession of admirable traits.

It seems appropriate to consider the proportion between a man's intrinsic worth and the honor he receives. The distribution of honors raises questions of justice—in fact, it is thought to be one of the chief problems of distributive justice. For those who hold that honor and fame are utterly distinct in principle, this is the clear mark of their difference. Justice does not require that fame be proportionate to virtue. Though there is a sense in which fame may not be deserved, the qualities in a person which justify fame are of a different order from those which honor should reward. Fame belongs to the great, the outstanding, the exceptional, without regard to virtue or vice. Infamy is fame no less than good repute. The great scoundrel can be as famous as the great hero. Existing in the reputation a man has regardless of his character or accomplishments, fame does not

tarnish, as honor does, when it is unmerited. But for the same reason, fame is often lost as fortuitously as it is acquired. "Fame has no stability," Aquinas observes; "it is easily ruined by false report. And if it sometimes endures, this is by accident."

THE DISTINCTION between honor and fame is not acknowledged by those who ignore merit as a condition of praise. Machiavelli, for example, places fame—or, as he sometimes calls it, glory—in that triad of worldly goods which men want without limit and without relation to justice. If the aim of life is to get ahead in the world, money, fame, and power are the chief marks of success. A man is deemed no less successful if he acquires power by usurping it, or gains it by foul means rather than fair; so, too, if he becomes famous through chicanery or deception and counterfeits whatever form of greatness men are prone to praise.

Along with riches, fame, says Machiavelli, is "the end which every man has before him." This men seek to obtain by various methods: "one with caution, another with haste; one by force, another by skill; one by patience, another by its opposite; and each one succeeds in reaching the goal by a different method." Some methods, he admits in another place, "may gain empire, but not glory," such as "to slay fellow-citizens, to deceive friends, to be without faith, without mercy, without religion." Nevertheless, he declares: "Let a prince have the credit of conquering and holding a state, the means will always be considered honest, and he will be praised by everybody."

Because fame seems to be morally neutral, it replaces honor in the discussions of those who measure men in terms of success instead of virtue, duty, or happiness. Because it is morally neutral, it is the term used by those who wish to judge, not men, but the impression they make. What counts is the magnitude of that impression, not its correspondence with reality.

To be famous is to be widely, not necessarily well, spoken of by one's fellow men, now or hereafter. The man who stands above the herd, whose outlines are clear and whose deeds are memorable, takes his place among the famous of his time or of all times. Plutarch the moralist certainly does not regard the men whose lives

he writes as paragons of virtue. On the contrary, he plainly indicates that many of them are examples of extraordinary depravity. But Plutarch the biographer treats them all as famous. He takes that as a matter of historic fact, not of moral judgment. Good or bad, they were acknowledged to be great men, leaders, figures of eminent proportions, engaged in momentous exploits. They were not all victorious. Few if any were successful in all that they attempted or were able to preserve what successes they achieved. But each ventured beyond the pale of ordinary men; and each succeeded at least in becoming a symbol of great deeds, a monument in human memory.

The opposite of fame is anonymity. In Dante's moral universe, only the Trimmers on the rim of Hell are totally anonymous; neither good nor bad, they lack name and fame. Because they "lived without infamy and without praise," Hell will not receive them, "for the damned would have some boast of them." To them alone no fame can be allowed. Honor and glory belong only to the blessed, but the damned in the pits of Hell, by the record they left for men to revile, are as well remembered, and hence as famous, as the saints in Heaven.

THAT MEN NORMALLY desire the esteem of their fellow men seems to be undisputed. "He must be of a strange and unusual constitution," Locke writes, "who can content himself to live in constant disgrace and disrepute with his own particular society. Solitude many men have sought, and been reconciled to; but nobody that has the least thought or sense of a man about him, can live in society under the constant dislike and ill opinion of his familiars, and those he converses with. This is a burden too heavy for human sufferance."

A society of misanthropes, despising each other, is as unthinkable as an economy of misers. The social nature of man requires sympathy and fellow feeling, love and friendship, and all of these involve some measure of approval based on knowledge or understanding. According to one theory, the highest type of friendship springs from mutual admiration, the respect which men have for one another. The old saying that "there is honor among thieves" suggests that even among bad men there is a

desire to hold the approbation of those who share a common life. With this in mind apparently, William James describes fame and honor as a man's "image in the eyes of his own 'set,' which exalts or condemns him as he conforms or not to certain requirements that may not be made of one in another walk of life."

Though Pascal regards "the pursuit of glory" as "the greatest baseness of man," he must admit that "it is also the greatest mark of his excellence; for whatever possessions he may have on earth, whatever health and essential comfort, he is not satisfied if he has not the esteem of men. He values human reason so highly that, whatever advantages he may have on earth, he is not content if he is not also ranked highly in the judgment of man. . . . Those who most despise men, and put them on a level with brutes, yet wish to be admired and believed by men, and contradict themselves by their own feelings."

But is this universal wish for the esteem of others a desire for honor or a desire for fame? Does it make any difference to our conception of happiness whether we say that men cannot be happy without honor or that they cannot be happy unless they are famous?

Even those who do not distinguish between honor and fame are led by these questions to discriminate between fame and infamy. As we have already noted, fame and infamy are alike, since both involve the notoriety enjoyed by the outstanding, the exceptional, the great, whether good or bad. If what men desire is simply to be known by others, and to have a kind of immortality through living on in the memory of later generations, then evil will serve as well as good repute. All that matters is the size of the reputation, and its vitality. But if the desire is for approbation or praise, good opinion alone will satisfy, and then the question becomes whether the object is fame or honor. Which does Iago have in mind when he says, "Good name in man and woman, dear my Lord, is the immediate jewel of their souls"?

Opposite answers seem to be determined by opposite views of human nature and human happiness. Those who, like Plato, think that virtue is an indispensable ingredient of happiness, include honor among the "good things"

which the virtuous man will seek in the right way. Possession of good things by itself is not sufficient, Socrates says in the *Euthydemus*. A man must also use them and use them well, for "the wrong use of a thing is far worse than the non-use." Applied to honor, this would seem to mean that the virtuous man will not seek praise for the wrong reasons—either for that which is not praiseworthy in himself or from others whose lack of virtue disqualifies them from giving praise with honesty. The virtuous man will not seek fame or be unhappy lacking it, for fame, like pleasure or wealth, can be enjoyed by bad men as well as good and be sought for wrong as well as right reasons or in the wrong as well as the right way. Virtue, according to the moralists, protects a man from the seductions of money, fame, and power—the things for which men undisciplined by virtue seem to have an inordinate desire.

In the theory of virtue, honor, unlike fame, belongs only to the good and is always a good object, worthy of pursuit. Honor is, in fact, the object of two virtues which Aristotle defines in the *Ethics*. One of these virtues he calls "ambition," and the Greek name for the other, which is literally rendered by "high-mindedness," is sometimes translated by the English word "magnanimity" and sometimes by "pride." The Christian connotation of "pride" makes it a difficult word to use as the name for a virtue, but it can nevertheless be so used when it is understood to mean a justifiable degree of self-respect—not conceit but a middle-ground between undue self-esteem and inordinate self-deprecation. When the Aristotelian names for these two vices are translated in English by "vanity" and "humility," it is again necessary to point out that "humility" must be understood, not in its Christian significance as meaning the virtue of the truly religious man, but rather as signifying an exaggerated meekness or pusillanimity.

The difference between pride and ambition lies in the magnitude of the other virtues they accompany and the scale of honor with which they are concerned. Both are concerned with honor, which Aristotle calls "the greatest of external goods." In both cases, "honor is the prize of virtue, and it is to the good that it is rendered." The proud man is one "who, being

truly worthy of great things, also thinks himself worthy of them; for he who does so beyond his deserts is a fool, but no virtuous man is foolish or silly." The proud man will be pleased "only by honors that are great and that are conferred by good men . . . Honor from casual people and on trifling grounds, he will utterly despise, since it is not this that he deserves."

Humility and vanity are, according to Aristotle, the vices of defect and excess which occur when a man fails to be proud. The unduly humble man, underestimating his worth, does not seek the honor he deserves. The vain man, at the other extreme, overestimates himself and wants honor out of proportion to his qualities. Honor, like any other external good, "may be desired more than is right, or less, or from the right sources and in the right way. We blame both the over-ambitious man as aiming at honor more than is right and from the wrong sources, and the unambitious man as not willing to be honored even for noble reasons."

However words are used, the point seems to be clear. It is possible for men to desire honor more than they should and less. It is also possible for honor to be rightly desired. Honor desired to excess or in the wrong way may be called "fame," even as the excessive desire for honor is sometimes regarded as the vice of ambition or an aspect of the sin of pride. The word "pride" seems to have both a good and a bad connotation. But the point remains that the difference between these two meanings of "pride," like the difference between honor and fame, is understood by moralists in terms of virtue, and it is discounted by those who reject the relevance of virtue.

THOUGH HONOR MAY be regarded as inseparable from virtue in moral theory, certain political philosophers make its separation from virtue the principle of a type of government.

In Plato's *Republic*, monarchy and aristocracy are defined in terms of the virtue of the rulers—either of the one wise man or of the excellent few. Government by the few is oligarchy rather than aristocracy when wealth rather than virtue is the principle of their selection. Plato sees the possibility of an intermediate between these two which occurs as a kind of transitional form when aristocracy

tends to degenerate into oligarchy. He calls that intermediate "timocracy" and describes it as "a mixture of good and evil" in which the ruler is "a lover of power and a lover of honor, claiming to be a ruler, not because he is eloquent, or on any ground of that sort, but because he is a soldier and has performed feats of arms." In such a state, he claims, "one thing, and one thing only, is predominantly seen—the spirit of contention and ambition; and these are due to the prevalence of the passionate or spirited element." In a timocracy, in other words, honor is divorced from virtue and wisdom and becomes the only qualification for public office.

With Montesquieu, the situation is quite reversed. For him, virtue is absolutely requisite in popular government or democracy, and to a less extent in that other form of republic which he calls "aristocracy." As virtue is necessary in a republic, so is honor in a monarchy. "Honor—that is, the prejudice of every person and rank—supplies the place of political virtue. A monarchical government supposes pre-eminences and ranks, as likewise a noble descent. Since it is the nature of honor to aspire to preferments and titles, it properly placed in this government."

Though Montesquieu and Plato differ in their classification of the forms of government, they seem to agree that honor divorced from virtue is a counterfeit. Honor identified with ranks and titles, honor which moves individuals to serve the public good in order to promote their own interests, Montesquieu admits is a false honor, "but even this false honor is as useful to the public as true honor could possibly be to private persons." Considering the laws of education characteristic of monarchical governments, Montesquieu points out that it is not in colleges or academies, but in the world itself, which is the school of honor, that the subjects of monarchy are chiefly trained. "Here the actions of men are judged, not as virtuous, but as shining; not as just, but as great; not as reasonable, but extraordinary."

HEROISM IS DISCUSSED in the chapter on COURAGE, and the role of the hero—the leader or great man—in the chapter on HISTORY. Here we are concerned with the hero in the esteem of

his fellow men, the symbol of human greatness and the object of human admiration.

Honor, fame, and glory combine in various proportions to constitute the heroic figures of classical antiquity: honor, to the extent that none is without some virtue and each possesses certain virtues at least to a remarkable degree; fame, because they are the great among men, outstanding and well-known, godlike in their pre-eminence; and glory, almost in the theological sense, inasmuch as the heroes celebrated by Homer and Virgil are beloved by the gods.

It is not accidental that the central figure in the Greek tragedies is called a "hero," since in the ancient view the tragic character must necessarily belong to a great man, a man of noble proportions, one who is "better than the ordinary man," says Aristotle. If he also has some fault or flaw, it is a consequence of strength misused, not a mark of individual weakness. Such weakness as he has is the common frailty of man.

In the modern world heroism and the heroic are more difficult to identify or define. We tend to substitute the notion of genius in considering the exceptionally gifted among men. Glory is dimly recognized and honor takes second place to fame. That portion of modern poetry which deals in heroes—as, for example, the tragedies and historical plays of Shakespeare—borrows them from, or models them on, legendary figures. The great modern novels, counterparts of the epic poems of antiquity, portray exceptional men and women without idealizing them to heroic stature. One of these novels, Tolstoy's *War and Peace*, seeks to deflate the fame of great men. They do not deserve even their reputation for great deeds, much less the honor owed the truly great.

"If we assume as historians do that great men lead humanity to the attainment of certain ends . . . then it is impossible," Tolstoy declares, "to explain the facts of history without introducing the conceptions of *chance* and *genius*." But in Tolstoy's opinion "the words *chance* and *genius* do not denote any really existing thing and therefore cannot be defined." We can dispense with these meaningless words, he thinks, if we are willing to renounce "our claim to discern a purpose immediately intelligible to us" and admit "the ultimate purpose to be beyond

our ken." Then "not only shall we have no need to see exceptional ability in Napoleon and Alexander, but we shall be unable to consider them to be anything but like ordinary men; and we shall not be obliged to have recourse to *chance* for an explanation of those small events which made these people what they were, but it will be clear that all those small events were inevitable."

This view of history, with its emphasis on impersonal forces, finds another expression in Marxist theory. The machine and the proletariat at mass are the heroes of history, or of the revolution. Yet the modern period is not without an opposite strain of thought. Machiavelli calls for a great man, a hero, to become the "liberator" of Italy, "who shall yet heal her wounds and put an end to the ravaging and plundering of Lombardy, to the swindling and taxing of the kingdom and of Tuscany, and cleanse those sores that for long have festered." His maxims for the prince may be read, not merely as advice for getting and holding power, but as preparing for an heroic effort in which the prince's power and fame will be used for liberty. The great man has the historic mission of a pioneer, not the role of a puppet.

Even in the Renaissance, however, Machiavelli is answered by Montaigne, who prizes moderation too much to praise heroism more than a little. Comparing Socrates and Alexander, Montaigne places all of the latter's actions under the maxim, "Subdue the world," whereas Socrates, he says, acts on the principle that it is wise "to carry on human life conformably with its natural condition." To Montaigne, "the virtue of the soul does not consist in flying high, but in walking orderly; its grandeur does not exercise itself in grandeur, but in mediocrity."

The mediaeval Christian conception of heroism centers on the practice of heroic virtue, by which the theologian defines sanctity. In the calendar of saints, there is every type of spiritual excellence, but all alike—martyrs, virgins, confessors, doctors—are regarded as having, with God's grace, superhuman strength. The saints not only perform acts of exemplary perfection; they are godlike men in their exemption from the frailties of human flesh.

The heroes of antiquity also wear an aspect

of divinity, but, like Achilles, each has a weakness in his armor. Moreover, the heroes of the *Iliad*, the *Odyssey*, and the *Aeneid* are men of overweening pride. They are relentlessly jealous of their honor. They strive not so much for victory as for the due meed of honor which is its fruit. Nothing grieves them so much as to have their deeds go unrequited by abundant praise. In the contribution made by this love of praise to the growth of the Roman empire, Augustine sees the providential working of God. In order that that empire "might overcome the grievous evils which existed among other nations," he writes, God "purposely granted it to such men as, for the sake of honor, and praise, and glory, consulted well for their country, in whose glory they sought their own, and whose safety they did not hesitate to prefer to their own, suppressing the desire of wealth and many other vices for this one vice, namely, the love of praise."

To Augustine, however, this glory found in human praise is far removed from the true glory. It is, in fact, a sin. "So hostile is this vice to pious faith," he writes, "if the love of glory be greater in the heart than the fear or love of God, that the Lord said, 'How can ye believe, who look for glory from one another, and do not seek the glory which is from God alone?'"

The Christian hero, consequently, seeks not his own glory, but the glory of God, and in contrast to the pagan hero, he is great, not in pride, but in humility. His model is seen in the Apostles, who, according to Augustine, "amidst maledictions and reproaches, and most grievous persecutions and cruel punishments, were not deterred from the preaching of human salvation. And when . . . great glory followed them in the church of Christ, they did not rest in that as in the end of their virtue, but referred that glory itself to the glory of God . . . For their Master had taught them not to seek to be good for the sake of human glory, saying, 'Take heed that ye do not your righteousness before men to be seen of them' . . . but 'Let your works shine before men, that they may see your good deeds, and glorify your Father who is in heaven.'"

The word "glory" in its theological connotation thus has a meaning distinct from, and even opposed to, the sense in which it is sometimes

used as a synonym for "fame." In the liturgy of the church, the psalms and hymns (especially those of the doxology which sing the *gloria Patri* and the *gloria in excelsis Deo*) render unto God the homage which is due His infinite goodness, the reflexive splendor of which is the divine glory. As in the strict moral sense honor on the human plane is due to virtue alone, so in a strict theological sense glory belongs only to God.

Strictly, God's glory cannot be increased by human recognition. Yet every act of religious devotion is said to redound to the greater glory of God and to diffuse His glory among creatures through the divinity they acquire when they love God and are beloved by Him. God is "all

fullness in Himself and the height of all perfection"; nevertheless, Montaigne writes, "His name may be augmented and increased by the blessing and praise we attribute to His exterior works."

According to Dante, "the glory of Him who moves everything penetrates through the universe, and is resplendent in one part more and in another less." In his journey through Paradise, he beholds the saints whom God loves especially, each with a distinct degree of glory according to the proximity with which he approaches the presence of God. Their halos and aureoles, in the imagery of Christian art, are the symbols of the glory in which they are bathed as in reflected light.

OUTLINE OF TOPICS

	PAGE
1. The relation of honor and fame: praise and reputation	736
2. Honor and fame in the life of the individual	737
2a. The sense of honor and of shame: loyalty to the good	
2b. Honor as an object of desire and as a factor in virtue and happiness	
2c. Honor as due self-esteem: magnanimity or proper pride	739
2d. Honor or fame as a mode of immortality	
2e. Honor as the pledge of friendship: the codes of honor among social equals	740
3. The social realization of honor and fame	
3a. The reaction of the community to its good or great men	
3b. The conditions of honor or fame and the causes of dishonor or infamy	741
4. Honor in the political community and in government	742
4a. Honor as a principle in the organization of the state: timocracy and monarchy	
4b. The scale of honor in the organization of the state: the just distribution of honors	743
4c. Honor as a political technique: the uses of praise, prestige, public opinion	
5. Honor, fame, and the heroic	744
5a. Honor as a motivation of heroism	
5b. Hero-worship: the exaltation of leaders	
5c. The occasions of heroism in war and peace	745
5d. The estimation of the role of the hero in history	
6. The idea of glory: its distinction from honor and fame	746
6a. The glory of God: the signs and the praise of the divine glory	
6b. The reflected glory of the angels and saints	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 36: HYPOTHESIS

INTRODUCTION

A COMPARISON of their Greek and Latin roots shows that the English words “hypothesis” and “supposition” are synonymous. To hypothesize or to suppose is *to place under*—to make one thing the basis of another in the process of thought.

The word “hypothesis” is today often popularly misapplied to mean a guess or hunch. The sleuth in a detective story speaks of having an hypothesis about who committed the crime. The popular notion of what it means to suppose something, or to entertain a supposition, more accurately reflects the meaning of hypothesis in logic, mathematics, and scientific or philosophical method.

A supposition is generally understood to be something taken for granted, something assumed for the purpose of drawing implications or making inferences. What is supposed is not known to be true; it may be true or false. When we make a supposition, our first concern is to see what follows from it, and only then to consider its truth in the light of its consequences. We cannot reverse this order, when we employ suppositions, and ask first about their truth.

The word “if” expresses the essence of supposing. The word “then” or the phrase “it follows that” introduces the consequences for the consideration of which we make the supposition. We are not interested in the “if” for its own sake, but for the sake of what it may lead to. In any statement of the “if . . . then . . .” sort, it is the if-clause which formulates the supposition or the hypothesis; the other part of the statement, the then-clause, formulates the consequences or implications. The whole complex statement, which makes an *if* the logical basis for a *then*, is not an hypothesis. Rather it is what is traditionally called in logic a hypothetical proposition.

THERE IS ONE USE of the word “hypothesis” in mathematics which seems at odds with the foregoing summary. In Euclid’s *Elements*, for example, an hypothesis is that which is given, not as the basis from which the conclusion is drawn or proved, but as a condition of solving the geometric problem under consideration. Let us take Proposition 6 of Book I. It reads: “*If* in a triangle two angles be equal to one another, *then* the sides which subtend the equal angles will also be equal to one another.” In the demonstration of this theorem, a triangle having two equal angles is regarded as *given* or *granted*. That figure or geometrical condition is a fact obtained by *hypothesis*. It is the fact stated in the hypothesis, or the if-clause, of the theorem.

If the geometrical reality of that fact itself is questioned, the answer would have to be obtained by a prior proof that such a figure, conforming to the definition of an isosceles triangle, can be constructed by the use of no other instruments than a straight edge and a compass. The construction is not made, however, as part of the proof of Theorem 6, any more than is the demonstration of an antecedent theorem, which may have to be used in the proof of Theorem 6. In the proof of Theorem 6, the first line, beginning with the word “let,” declares that the constructibility of the figure is to be taken for granted as a matter of hypothesis.

The whole problem of Theorem 6 is to prove that the then-clause follows from the if-clause. Euclid appears to accomplish this by introducing other propositions—drawn from his axioms, definitions, postulates, or theorems previously demonstrated—which establish this connection and so certify the conclusion as following from the hypothesis. Two points about this procedure should be noted.

First, the conclusion does not follow from

the hypothesis directly, for if that were so, the "if-then" proposition would be self-evident and would need no proof. The mind which sees immediately that the sides opposite to the equal angles in an isosceles triangle are necessarily equal does not need any demonstration of the connection between equal angles and equal sides. The Euclidean demonstration consists in making this connection, which is not *immediately* evident, *mediately* evident; that is, evident through the mediation of other propositions. It is not the hypothesis alone which proves the conclusion, but the hypothesis in the company of other propositions which serve to take the mind step by step from the hypothesis granted to the conclusion implied.

Second, the proposition with the truth of which the reasoning seems to end is not the proposition to be proved. The Q.E.D. at the end of a Euclidean demonstration does not apply to the last proposition in the line of proof, but to the theorem itself, for that is the proposition to be proved. The last proposition in the reasoning is merely the consequent which, according to the theorem, is proposed as following from the hypothesis. When he is able to verify the proposed connection between the hypothesis and its conclusion or consequent, Euclid says Q.E.D. to the theorem as a whole—the whole *if-then statement*.

The process of proof seems to be the same when the theorem is stated categorically rather than hypothetically. For example, Theorem 6 might have been stated, as other Euclidean theorems are, in the following manner: "The sides subtended by equal angles in a triangle are also equal to one another." This variation in mode of statement raises a question, not about the meaning of "by hypothesis" in Euclidean proof, but about the difference between hypothetical and categorical propositions, which we will consider later.

THE EUCLIDEAN USE of a given (that is, a constructible) figure as an hypothesis does not seem to be a method of making a supposition in order to discover its implications. Nor does it seem to be a way of testing the truth of an hypothesis by reference to its consequences. Both of these aspects of hypothetical reasoning do appear, however, in Plato's dialogues.

In the *Meno*, for example, Socrates proposes, at a certain turn in the conversation about virtue and knowledge, that he and Meno entertain the hypothesis that virtue *is* knowledge. Socrates immediately inquires about the consequences. "If virtue is knowledge," he asks, "will it be taught?" Since Meno already understands that knowledge is teachable, he answers the question affirmatively. The utility of advancing the hypothesis that virtue is knowledge gradually appears in the next phase of the dialogue, wherein it is discovered that virtue is not teachable at all, or at least not in the way in which the arts and sciences are teachable. The discovery throws some doubt on the truth of the hypothesis that virtue is knowledge; at least it does not seem to be knowledge in the same sense as science or art.

This mode of reasoning exemplifies the use of an hypothesis to test its truth in terms of its consequences. The underlying logical principle is that the denial of the consequences requires a denial of the antecedent hypothesis, just as an affirmation of the antecedent would require an affirmation of the consequent. Nothing follows logically from a denial of the hypothesis, or from an affirmation of its consequences.

This example from the *Meno* also illustrates the difference between Euclid's and Plato's use of hypotheses. Socrates is not here trying to prove that *if* virtue is knowledge, *then* virtue is teachable. The validity of the foregoing if-then statement is already understood in terms of the fact that *knowledge is teachable*. With the if-then statement accepted as valid, Socrates uses it for the purpose of ascertaining whether or in what sense virtue is knowledge. It is not the hypothetical or if-then statement which is proved, but the hypothesis—the antecedent in that statement—which is tested.

The same general method of employing hypotheses and testing them is found in the empirical sciences. In medical practice, the physician, according to Hippocrates, "must be able to form a judgment from having made himself acquainted with all the symptoms, and estimating their powers in comparison with one another"; he should then "cultivate prognosis," since "he will manage the cure best who has foreseen what is to happen from the present state of matters."

The preliminary diagnosis states an hypothesis (what the disease may be) and the prognosis foresees a set of consequences (what is likely to happen if the diagnosis is correct). Observation of the course of the symptoms and the patient's changing condition will either confirm or invalidate the prognosis. Confirmation leaves the diagnosis a lucky guess, but fails to prove it. If the disease does not run the predicted course, however, the diagnosis on which the prognosis was based can be dismissed as a false hypothesis.

WHEN AN HYPOTHESIS takes the form of a prediction of what should happen if the hypothesis is true, the failure of the consequences to occur refutes the hypothesis. Though discussions of scientific method frequently speak of "prediction and verification," it would seem as though prediction can only lead to the refutation of an hypothesis rather than to its verification. An hypothesis is overthrown when its prediction fails, but it is not verified when its prediction comes true. To think that it can be verified in this way is to commit the logical fallacy of arguing from the truth of a conclusion to the truth of its premises. How, then, do empirical scientists prove an hypothesis to be true? What do they mean by prediction and verification in relation to the use of hypothesis?

There seem to be two possible ways in which an hypothesis can be proved by empirical or experimental research. One way can be used when we know that the consequences implied follow *only* from the truth of the hypothesis. Should the consequences implied be impossible *unless* the supposed condition exists, then the confirmation of the prediction verifies the hypothesis.

The other possible method of verification has come to be called "the method of multiple working hypotheses." The validity of this method depends on our knowing that the several hypotheses being entertained *exhaust* all the relevant possibilities. Each hypothesis generates a prediction; and if upon investigation the observed facts negate every prediction except one, then that one remaining hypothesis is verified. If negative instances have eliminated the false hypotheses, the hypothesis remaining must be true, on the condition, of course, that it is the *only* possibility which is left.

Both of these methods seem to be valid only if a prerequisite condition is fulfilled. To verify one of a series of multiple hypotheses through the elimination of the others, the scientist must know that the hypotheses enumerated are truly *exhaustive*. In the verification of a single hypothesis by the confirmation of its prediction, the scientist must know that the observed consequences can follow from no other supposition. Since such knowledge is often unavailable, probability rather than complete proof results from the testing of hypotheses by observation or experiment.

In his *Treatise on the Vacuum*, Pascal offers a summary of the logical situation by distinguishing the true, the false, and the doubtful or probable hypothesis. "Sometimes its negation brings a conclusion of obvious absurdity, and then the hypothesis is true and invariable. Or else one deduces an obvious error from its affirmation, and then the hypothesis is held to be false. And when one has not been able to find any mistake either in its negation or its affirmation, then the hypothesis remains doubtful, so that, in order that the hypothesis may be demonstrable, it is not enough that all the phenomena result from it, but rather it is necessary, if there ensues something contrary to a single one of the expected phenomena, that this suffice to establish its falsity."

BOTH THE USE of hypotheses and the method of verifying them vary from science to science, according as the character of the science happens to be purely empirical (e.g., the work of Hippocrates, Darwin, Freud), or experimental (e.g., the work of Harvey and Faraday), or a combination of experimentation with mathematical reasoning (e.g., the work of Galileo, Newton, Fourier). Not all scientific work is directed or controlled by hypotheses, but in the absence of well-formulated hypotheses, the research can hardly be better than exploration.

A well-constructed experiment, especially what Bacon calls an *experimentum crucis*, derives its demonstrative character from the hypothetical reasoning which formulates the problem to be solved. The value of such a crucial experiment appears in Bacon's reasoning about the rise and fall of the tides. "If it be found," he writes, "that during the ebb the surface of the

waters at sea is more curved and round, from the waters rising in the middle, and sinking at the sides or coast, and if, during a flood, it be more even and level, from the waters returning to their former position, then assuredly, by this decisive instance, the raising of them by a magnetic force can be admitted; if otherwise, it must be entirely rejected."

In the field of mathematical physics, and particularly in astronomy, the meaning of hypothesis is both enlarged and altered. So far we have considered hypotheses which are single propositions implying certain consequences. But in mathematical physics, a whole theory—a complex system of propositions—comes to be regarded as a single hypothesis.

In his preface to the work of Copernicus, Osiander says that the task of the astronomer is "to use painstaking and skilled observation in gathering together the history of the celestial movements; and then—since he cannot by any line of reasoning reach the true causes of these movements—to think up or construct whatever causes or hypotheses he pleases, such that, by the assumption of these causes, those same movements can be calculated from the principles of geometry, for the past and for the future too." The elaborate system constructed by Copernicus and the system constructed by Ptolemy which Copernicus hopes to replace are sometimes called "the Copernican hypothesis" and "the Ptolemaic hypothesis"; and sometimes these two theories are referred to as "the heliocentric hypothesis" and "the geocentric hypothesis."

A whole theory, regarded as an hypothesis, must be tested in a different way from a single proposition whose implication generates a prediction. As rival hypotheses, one theory may be superior to another in internal consistency or in mathematical simplicity and elegance. Kepler is thus able to argue against Ptolemy by appealing to criteria which Ptolemy accepts, pointing out that Ptolemy himself wishes "to construct hypotheses which are as simple as possible, if that can be done. And so if anyone constructs simpler hypotheses than he—understanding simplicity geometrically—he, on the contrary, will not defend his composite hypotheses."

But even if the Copernican hypothesis is superior on the grounds of being geometrically

simpler, it must meet another test. As indicated in the chapter on ASTRONOMY, mathematical theories about physical phenomena must be more than ideal constructions of possible universes. They must try to account for this one real world and are therefore subject to the test of their applicability to reality. However elegant it may be mathematically, an hypothesis—when considered from the point of view of physics—is satisfactory only if it accounts for the phenomena it was invented to explain. In the words of Simplicius, it must "save the appearances."

An hypothesis can therefore be tested for its application to reality by the way in which it fits the observed facts. "In those sciences where mathematical demonstrations are applied to natural phenomena," Galileo writes, "the principles" which are "the foundations of the entire superstructure" must be "established by well-chosen experiments." By such means Galileo chooses between the hypothesis that the uniform acceleration of a freely falling body is proportional to the units of space traversed and the hypothesis that it is proportional to the units of time elapsed.

To borrow Plato's expression in the *Timaeus*, the mathematical consistency of a theory makes it "a likely story." The theoretical integrity of the hypothesis makes it credible. But when competing credible hypotheses exist, each saving the relevant appearances equally well, which is to be believed? The fact that one of them, as in the case of the Copernican-Ptolemaic controversy, is mathematically superior cannot decide the question, since the question is, Which is true of reality?

Sometimes a single fact, such as the phenomenon of the Foucault pendulum, may exercise a decisive influence, if one of the two competing theories finds that fact congenial and the other leaves it inexplicable. Sometimes, as appears in the discussion of the Copernican hypothesis in the chapter on ASTRONOMY, of two hypotheses which are equally satisfactory so far as purely astronomical phenomena are concerned, one may have the additional virtue of covering other fields of phenomena which that hypothesis was not originally designed to explain.

As interpreted by Kepler and as developed in Newton's theory of universal gravitation,

the Copernican hypothesis brings the terrestrial phenomena of the tides and of falling bodies under the same set of laws which applies to the celestial motions. The hypothesis then has the amazing quality of consilience—a bringing together under one formulation of phenomena not previously thought to be related. This seems to be what Huygens has in mind when he considers the degree of probability that is attainable through experimental research.” We have “scarcely less than complete proof,” he writes, when “things which have been demonstrated by the principles assumed, correspond perfectly to the phenomena which experiment has brought under observation; and further, principally, when one can imagine and foresee new phenomena which ought to follow from the hypotheses which one employs, and when one finds that therein the fact corresponds to our prevision.”

Then, in common parlance, we say that it is no longer a theory, but has become a fact. Yet the question remains whether the empirical tests which eliminate the less satisfactory hypothesis can ever make the more satisfactory hypothesis more than a likely story.

IN THE *Mathematical Principles of Natural Philosophy*, Newton says, “I have not been able to discover the cause of those properties of gravity from phenomena, and I frame no hypotheses; for whatever is not deduced from the phenomena is to be called an hypothesis; and hypotheses, whether metaphysical or physical, whether of occult qualities or mechanical, have no place in experimental philosophy.” The context of this passage, and of a similar statement at the end of the *Optics*, as well as the association in Newton’s mind of hypotheses with occult qualities, substantial forms, and hidden causes, seems to indicate a special meaning of “hypothesis.”

Newton criticizes the vortices in the physics of Descartes on the ground that it is unnecessary to appeal to occult or unobservable entities in order to explain natural phenomena. The Cartesian vortices, like the substantial forms of Aristotle, are, for Newton, hypotheses in a very special sense. They are *hypothetical entities*. They are not inferred from the phenomena. Although treated as if they were realities under-

lying the phenomena, they are, as Gilbert says of the *primum mobile*, a “fiction, something not comprehensible by any reasoning and evidenced by no visible star, but purely a product of imagination and mathematical hypothesis.”

There is almost a play on words in this identification of hypotheses with imaginary entities to which reality is attributed; for in their Greek and Latin roots, the words “hypothesis” and “hypostasis,” “supposition” and “substance,” are closely related. The first word in each of these pairs refers to a *proposition* which underlies reasoning, the second to a *reality* which underlies observable qualities or phenomena. To make hypotheses, in the sense in which Newton excludes them from experimental philosophy, is to *hypostatize* or to *reify*, that is, to make a thing out of, or to give reality to, a fiction or construction of the mind.

It has seemed to some critics that, no less than the Cartesian vortices, the ether in Newton’s theory of light is an hypothesis in precisely this sense—an imaginary entity. For many centuries, the atoms and molecules postulated to explain chemical combinations and changes were attacked as fictions and defended as useful hypotheses. On the one hand, there is an issue concerning the theoretic usefulness of such constructions; on the other, a question concerning their counterparts in reality.

It is sometimes thought that fictions are useful for purposes of explanation even when their unreality is admitted. Rousseau, for example, explicitly denies any historical reality to the idea of man living in a state of nature prior to the formation of society by the social contract. In this matter, he says, we can lay “facts aside, as they do not affect the question.” These related notions—the state of nature and the social contract—are “rather calculated to explain the nature of things, than to ascertain their actual origin; just like the hypotheses which our physicists daily form respecting the formation of the world.”

Similarly Lavoisier posits the existence of “caloric” for its explanatory value. “It is difficult,” he writes, “to comprehend these phenomena, without admitting them as the effects of a real and material substance, or very subtle fluid, which, insinuating itself between the particles of bodies, separates them from each

other; and, even allowing the existence of this fluid to be hypothetical, we shall see in the sequel, that it explains the phenomena of nature in a very satisfactory manner."

ONE OTHER MEANING of hypothesis remains to be considered. It is the sense in which postulates or assumptions are distinguished from axioms in the foundations of a science. In Euclid's geometry, as in Descartes', both sorts of principles appear. The axioms or common notions are those propositions which are immediately seen to be true without proof. The postulates or assumptions are hypotheses in the sense that their truth is taken for granted without proof.

Both sorts of propositions serve as principles or starting points for the demonstration of theorems, or the conclusions of the science. Both are principles of demonstration in that they are used to demonstrate other propositions without themselves being demonstrated. But axioms are traditionally regarded as intrinsically indemonstrable, whereas hypotheses—postulates or assumptions—may not be indemonstrable. They are simply asserted without demonstration.

The possibility of demonstrating an hypothesis gives it the character of a provisional assumption. In the *Discourse on Method*, Descartes refers to certain matters assumed in his *Dioptrics* and *Meteors*, and expresses his concern lest the reader should take "offence because I call them hypotheses and do not appear to care about their proof." He goes on to say: "I have not named them hypotheses with any other object than that it may be known that while I consider myself able to deduce them from the primary truths which I explained above, yet I particularly desired not to do so, in order that certain persons may not for this reason take occasion to build up some extravagant philosophical system on what they take to be my principles."

The distinction between axioms and postulates or hypotheses raises two issues. The first concerns the genuineness of the distinction itself. Axioms, self-evident propositions, or what William James calls "necessary truths," have been denied entirely or dismissed as tautologies. The only principles of science must then be

hypotheses—assumptions voluntarily made or conventionally agreed upon. This issue is more fully discussed in the chapter on PRINCIPLE. The other issue presupposes the reality of the distinction, but is concerned with different applications of it in the analysis of science.

Aristotle, for example, defines scientific knowledge in terms of three elements, one of which consists of the primary premises upon which demonstrations rest. The principles of a particular science may be axioms in the strict sense of being self-evident truths and hence absolutely indemonstrable; or they may be provisional assumptions which, though not proved in this science, can nevertheless be proved by a higher science, as in "the application of geometrical demonstrations to theorems in mechanics or optics, or of arithmetical demonstrations to those of harmonics." The latter are not axioms because they are demonstrable; yet in a particular science they may play the role of axioms insofar as they are used, without being demonstrated, to demonstrate other propositions.

Reasoning which rests either on axioms or on demonstrable principles Aristotle calls *scientific*, but reasoning which rests only on hypotheses he regards as *dialectical*. Reasoning results in scientific demonstration, according to Aristotle, "when the premises from which the reasoning starts are true and primary, or are such that our knowledge of them has originally come through premises which are primary and true." In contrast, reasoning is dialectical "if it reasons from opinions that are generally accepted," and, Aristotle explains, "those opinions are 'generally accepted' which are accepted by everyone or by the majority or by the philosophers—*i.e.*, by all, or by a majority, or by the most notable and illustrious of them." In another place, he adds one important qualification. In defining a dialectical proposition as one that is "held by all men or by most men or by the philosophers," he adds: "provided it be not contrary to the general opinion; for a man would assent to the view of the philosophers, only if it were not contrary to the opinions of most men."

For Aristotle, dialectical reasoning or argument moves entirely within the sphere of opinion. Even an opinion generally accepted, not only by the philosophers but also by most

men, remains an opinion. The best opinions are probabilities—propositions which are not self-evident and which cannot be proved. They are not merely *provisional* assumptions. Resting on assumptions which cannot ever be more than probable, the conclusions of dialectical reasoning are also never more than probable. Since they lack the certain foundation which axioms give, they cannot have the certitude of science.

Plato, on the other hand, seems to think that the mathematical sciences are hypothetical in their foundation, and that only in the science of dialectic, which he considers the highest science, does the mind rise from mere hypotheses to the ultimate principles of knowledge. "The students of geometry, arithmetic, and the kindred sciences," Socrates says in the *Republic*, "assume the odd and the even, and the figures and the three kinds of angle and the like in their several branches of science; these are their hypotheses, which they and everybody are supposed to know, and therefore they do not deign to give an account of them either to themselves or others." There is a higher sort of knowledge, he goes on, "which reason herself attains by the power of dialectic, using the hypotheses not as first principles, but only as hypotheses—that is to say, as steps and points of departure into a world which is above hypotheses, in order that she may soar beyond them to first principles."

The issue between Plato and Aristotle may be only verbal—a difference in the use of such words as "science" and "dialectic." Whether it is verbal or real is considered in the chapters on DIALECTIC and METAPHYSICS. In any case, the issue throws light on the difference between an hypothesis as a merely provisional assumption, susceptible to proof by higher principles, and an hypothesis as a probability taken for granted for the purposes of argument, which is itself incapable of being proved.

FINALLY WE COME to the meaning of "hypothetical" in the analysis of propositions and syllogisms. The distinction between the categorical and the hypothetical proposition or syllogism, briefly touched on in Aristotle's *Organon*, is developed in the tradition of logic which begins with that book.

In his work on *Interpretation* he distin-

guishes between simple and compound propositions. The compound proposition consists of several simple propositions in some logical relation to one another. In the tradition of logical analysis, three basic types of relation have been defined as constituting three different kinds of compound proposition. One type of relation is the *conjunctive*; it is signified by the word "and." Another is the *disjunctive*; it is signified by the words "either . . . or . . ." The third type is the *hypothetical* and is signified by the words "if . . . then . . ."

To take an example we have already used, "virtue is knowledge" and "virtue is teachable" are simple propositions. In contrast, the statement, "if virtue is knowledge, then virtue is teachable," is a compound proposition, hypothetical in form. If the proposition were stated in the sentence, "either virtue is knowledge or it is not teachable," it would be disjunctive in form; if stated in the sentence "virtue is knowledge and virtue is teachable," it would be conjunctive in form. In each of these three cases, the compound proposition consists of the two simple propositions with which we began, though in each case they appear to be differently related.

Whereas Aristotle divides propositions into simple and compound, Kant divides all judgments into the categorical, the hypothetical, and the disjunctive. In the categorical judgment, he says, "we consider two concepts"; in the hypothetical, "two judgements"; in the disjunctive, "several judgements in their relation to one another." As an example of the hypothetical proposition, he offers the statement, "If perfect justice exists, the obstinately wicked are punished." As an example of the disjunctive judgment, "we may say . . . [that] the world exists either by blind chance, or by internal necessity, or by an external cause." Each of these three alternatives, Kant points out, "occupies a part of the sphere of all possible knowledge with regard to the existence of the world, while all together occupy the whole sphere." The hypothetical judgment does no more than state "the relation of two propositions . . . Whether both these propositions are true remains unsettled. It is only the consequence," Kant says, "which is laid down by this judgement."

In the *Prior Analytics*, Aristotle distinguishes between the categorical and the hypothetical syllogism. The following reasoning is categorical in form: "Knowledge is teachable, virtue is knowledge; therefore, virtue is teachable." The following reasoning is hypothetical in form: "If virtue is knowledge, it is teachable; *but* virtue is knowledge; *therefore* it is teachable"; or "If virtue is knowledge, it is teachable; *but* virtue is not teachable; *therefore* it is not knowledge."

The basic issue with respect to the distinction between categorical and hypothetical syllogisms is whether the latter are always reducible to the former. One thing seems to be clear. The rules for the hypothetical syllogism formally parallel the rules for the categorical syllogism. In hypothetical reasoning, the consequent must be affirmed if the antecedent is affirmed; the antecedent must be denied if the consequent is denied. In categorical reasoning, the affirmation of the premises requires an affirmation of the conclusion, and a denial of the conclusion requires a denial of the premises.

With respect to the distinction between the categorical and hypothetical proposition, there is also an issue whether propositions stated in one form can always be converted into propositions having the other form of statement. In modern mathematical logic, for example, general propositions, such as "All men are mortal," are sometimes expressed in hypothetical form:

"If anything is a man, it is mortal." Logicians like Bertrand Russell think that the hypothetical form is more exact because it explicitly refrains from suggesting that men exist; it merely states that if the class 'man' should have any existent members, they will also belong to the class 'mortal.'

Apart from the question whether a universal proposition should or should not be interpreted as asserting the existence of anything, there seems to be a formal difference between the categorical and hypothetical proposition. This is manifest only when the hypothetical is truly a compound proposition, not when it is the statement of a simple proposition in hypothetical form, as, for example, the simple proposition "All men are mortal," is stated in hypothetical form by "If anything is a man, it is mortal." Because it is truly a compound proposition, and not merely the hypothetical statement of a general proposition, the proposition, "If virtue is knowledge, then virtue is teachable," cannot be restated in the form of a simple categorical proposition.

A simple proposition, whether stated categorically or hypothetically, may be the conclusion of either a categorical or a hypothetical syllogism. But the hypothetical statement which is really a compound proposition can never be the conclusion of any sort of syllogism, though it may be one of the premises in hypothetical reasoning.

OUTLINE OF TOPICS

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The use of hypotheses in the process of dialectic

- 7 PLATO: *Charmides*, 9d-10a / *Protagoras*, 49a / *Meno*, 183b-190a,c / *Phaedo*, 242b-243c / *Republic*, BK IV, 350d-351b; BK VI, 383d-388a esp 386d-388a; BK VII, 397a-398c / *Timaeus*, 462b-c / *Parmenides*, 491a-511d / *Sophist*, 570a-d
- 8 ARISTOTLE: *Prior Analytics*, BK I, CH I [24^a21-16] 39a-c / *Posterior Analytics*, BK I, CH 6 [75^a18-28] 103a-b / *Topics* 143a-223a,c esp BK I, CH I-3 143a-144b, CH IO-II 147b-148c, CH I4 149a-d, BK VIII 211a-223a,c
- 12 EPICTETUS: *Discourses*, BK I, CH 7 112b-113d
- 42 KANT: *Pure Reason*, 227a-230c esp 227d-228b / *Science of Right*, 457a-b / *Judgement*, 603b-c

2. Hypothetical reasoning and hypothetical constructions in philosophy

- 7 PLATO: *Meno*, 183b-190a,c / *Phaedo*, 242b-243c / *Republic*, BK VI, 386d-388a; BK VII, 397a-398c / *Parmenides*, 491a-511d
- 8 ARISTOTLE: *Posterior Analytics*, BK I, CH 2 [72^a19-21] 98d; BK II, CH 6 125d-126b / *Heavens*, BK I, CH 12 [281^b3-25] 373a-b / *Metaphysics*, BK IV, CH 3 [1005^b5-17] 524c-d
- 19 AQUINAS: *Summa Theologica*, PART I-II, Q 14, A 6, ANS 680c-681a
- 25 MONTAIGNE: *Essays*, 258d-259a

- 31 DESCARTES: *Rules*, XII, 23a-c / *Discourse*, PART II-III, 44c-50b passim; PART VI, 66a-b / *Meditations*, 72b,d; I-II, 75a-78a / *Objections and Replies*, 123d-124c
- 35 LOCKE: *Civil Government*, CH I, SECT I 25a-c / *Human Understanding*, BK II, CH I, SECT IO 123b-d; CH XIII, SECT 19-20 152c-d; CH XXIII, SECT I-2 204a-c
- 35 HUME: *Human Understanding*, SECT XI, DIV IO7 499c-500b
- 38 ROUSSEAU: *Inequality*, 329a-331d passim, esp 329d-330b; 333d-334a; 348a,c
- 42 KANT: *Pure Reason*, 7a-d; 176d-177b; 186d-187a; 194b-200c; 227a-230c; 232c-233d / *Science of Right*, 457a-b / *Judgement*, 603b-c
- 46 HEGEL: *Philosophy of History*, INTRO, 156d-158a
- 53 JAMES: *Psychology*, 84a-119b passim; 221a-238b; 820b-827a; 880b-886a esp 884b-886a

3. The foundations of mathematics: postulates, assumptions

- 7 PLATO: *Meno*, 183b-c / *Republic*, BK VI, 386d-388a; BK VII, 397c-d
- 8 ARISTOTLE: *Posterior Analytics*, BK I, CH I [71^a1-16] 97a-b; CH 2 [72^a19-24] 98d; CH IO 104d-105d; CH 12 [77^a36-15] 106c-d; BK II, CH 9 [93^b21-25] 128a-b / *Physics*, BK I, CH 2 [185^a1-3] 259c-d / *Heavens*, BK III, CH 4 [302^a27-31] 394a / *Metaphysics*, BK XI, CH 3

(3. The foundations of mathematics: postulates, assumptions.)

- [1061^a29-^b4] 589c; BK XIII, CH 2 [1077^b11]-CH 3 [1078^a31] 609a-d
- 9 ARISTOTLE: *Ethics*, BK VII, CH 8 [1151^a15-19] 402a
- 11 EUCLID: *Elements*, BK I, POSTULATES-COMMON NOTIONS 2a
- 11 ARCHIMEDES: *Sphere and Cylinder*, BK I, ASSUMPTIONS 404b / *Spirals*, 484b / *Quadrature of the Parabola*, 527a-b
- 31 DESCARTES: *Rules*, II, 2d-3b / *Meditations*, 73a / *Geometry*, BK II, 304a-305a; 316a-b
- 33 PASCAL: *Pensées*, I-5 171a-173a / *Vacuum*, 365b-366a / *Geometrical Demonstration*, 430b-439b passim; 442a-443b
- 34 NEWTON: *Principles*, 1a-b
- 34 HUYGENS: *Light*, PREF, 551b-552a
- 35 LOCKE: *Human Understanding*, BK IV, CH XII, SECT I-7 358c-360c passim
- 42 KANT: *Pure Reason*, 17d-18d; 24c-25b; 46a-c; 110a; 211c-218d esp 217a-c / *Practical Reason*, 302d-303b; 312c-d; 330d-331a / *Pref. Metaphysical Elements of Ethics*, 376c-d / *Judgement*, 551a-553c
- 43 FEDERALIST: NUMBER 31, 103c-104a
- 43 MILL: *Utilitarianism*, 445b-c
- 45 FOURIER: *Theory of Heat*, 175b
- 52 DOSTOEVSKY: *Brothers Karamazov*, BK V, 120d-121b
- 53 JAMES: *Psychology*, 869a-870a; 874a-878a

4. The role of hypotheses in science

- 7 PLATO: *Meno*, 183b-c / *Republic*, BK VI, 386d-388a / *Timaeus*, 447a-d
- 8 ARISTOTLE: *Meteorology*, BK I, CH 7 [344^a5-9] 450b / *Metaphysics*, BK XII, CH 6 [1071^b12]-CH 7 [1072^a22] 601b-602b; CH 8 603b-605a
- 10 HIPPOCRATES: *Prognostics*, par I 19a-b; par 25 26a,c
- 16 COPERNICUS: *Revolutions of the Heavenly Spheres*, 505a-506a
- 19 AQUINAS: *Summa Theologica*, PART I, Q 32, A I, REP 2 175d-178a; PART I-II, Q 14, A 6, ANS 680c-681a
- 30 BACON: *Novum Organum*, BK I, APH 105-106 128b-c
- 31 DESCARTES: *Rules*, XII, 23a-c / *Discourse*, PART VI, 66a-b
- 33 PASCAL: *Vacuum*, 368b-370a
- 34 NEWTON: *Principles*, BK III, RULE I 270a; RULE IV 271b; GENERAL SCHOL, 371b-372a / *Optics*, BK III, 543a-b
- 35 LOCKE: *Human Understanding*, BK IV, CH III, SECT I6 317a-c; CH XII, SECT I2-I3 362a-d
- 36 SWIFT: *Gulliver*, PART III, 118a-119a
- 42 KANT: *Pure Reason*, 7a-d / *Judgement*, 603b-c
- 45 LAVOISIER: *Elements of Chemistry*, PREF, 2a-b; 6d-7a; PART I, 23b-c
- 45 FOURIER: *Theory of Heat*, 184a
- 45 FARADAY: *Researches in Electricity*, 467a-b; 607a,c; 851a-c

49 DARWIN: *Origin of Species*, 239c / *Descent of Man*, 590a

51 TOLSTOY: *War and Peace*, BK XIII, 563a-b

53 JAMES: *Psychology*, 324b; 862a-866a; 882a-884b

54 FREUD: *Interpretation of Dreams*, 351c / *Narcissism*, 400d-401a / *Beyond the Pleasure Principle*, 661c-662b

4a. Theories, provisional assumptions, fictions, reifications

- 7 PLATO: *Meno*, 183b-c / *Republic*, BK VI, 386d-388a; BK VII, 397c-d / *Timaeus*, 447d-450c / *Laws*, BK VII, 730a-c
- 8 ARISTOTLE: *Posterior Analytics*, BK I, CH I0 [76^b22-77^a4] 105c-d / *Heavens*, BK I, CH I2 [281^b3-25] 373a-b; BK II, CH 5 379b-c / *Metaphysics*, BK VI, CH I [1025^b1-13] 547b; BK XI, CH 7 [1064^a4-9] 592b; BK XII, CH 6 [1071^b12]-CH 7 [1072^a22] 601b-602b; CH 8 603b-605a
- 11 ARCHIMEDES: *Equilibrium of Planes*, BK I, POSTULATES 502a-b / *Floating Bodies*, BK I, POSTULATE I 538a; POSTULATE 2 541b
- 16 PTOLEMY: *Almagest*, BK III, 83a; 86b-87a; BK IX, 270b-273a; 291a-292a; BK XIII, 429a-b
- 16 COPERNICUS: *Revolutions of the Heavenly Spheres*, BK I, 513b-514b; BK III, 628b-629a; BK IV, 675b-678a; BK V, 740a-b; 784b-785b
- 16 KEPLER: *Epitome*, BK IV, 863b-872b; 890b-892a; 929a-b; 932a-933a; BK V, 964b; 966a-967a; 984b-985b; 991a-994b / *Harmonies of the World*, 1023b-1080b
- 19 AQUINAS: *Summa Theologica*, PART I, Q 32, A I, REP 2 175d-178a
- 25 MONTAIGNE: *Essays*, 258d-259a
- 28 GILBERT: *Loadstone*, BK VI, 108b-110b
- 28 GALILEO: *Two New Sciences*, SECOND DAY, 179c-d; THIRD DAY, 200a-d; 203d-205b; FOURTH DAY, 240d-241c
- 28 HARVEY: *Circulation of the Blood*, 316a-318b passim, esp 316a-b / *On Animal Generation*, 383d
- 30 BACON: *Novum Organum*, BK I, APH 66 114d-115c; BK II, APH 36, 165d-166b; APH 46, 178c
- 31 DESCARTES: *Rules*, XII, 23a-c
- 33 PASCAL: *Pensées*, 72, 182b / *Vacuum*, 367a-370a
- 34 NEWTON: *Principles*, BK II, HYPOTHESIS I 285a; HYPOTHESIS II 331b; GENERAL SCHOL, 371b-372a / *Optics*, BK I, 379a; BK III, 516a-544a esp 520a-522b, 525b-530b
- 34 HUYGENS: *Light*, CH I, 557b-560b
- 35 LOCKE: *Human Understanding*, BK IV, CH III, SECT I6 317a-c; CH XII, SECT I3 362c-d
- 36 SWIFT: *Gulliver*, PART III, 118a-119a
- 42 KANT: *Pure Reason*, 227d-228b / *Science of Right*, 457a-b / *Judgement*, 603b-c
- 43 MILL: *Utilitarianism*, 445b-c
- 45 LAVOISIER: *Elements of Chemistry*, PART I, 9a-10b
- 45 FARADAY: *Researches in Electricity*, 273a-277a; 758a-759c; 777d-778c; 830b-832c; 850b,d-855a,c esp 850b,d-851c

- 49 DARWIN: *Origin of Species*, 42a
 53 JAMES: *Psychology*, xiii-b-xiv-a; 95a; 231b [fn 3]
 54 FREUD: *Narcissism*, 400d-401d / *Instincts*, 412a-b / *General Introduction*, 483d-485a / *New Introductory Lectures*, 818c-819b

4b. The purpose of hypotheses: saving the appearances; the formulation of predictions

- 7 PLATO: *Meno*, 183b-c / *Republic*, BK VI, 386d-388a; BK VII, 397a-398c / *Timaeus*, 447a-d
 8 ARISTOTLE: *Heavens*, BK II, CH 5 379b-c; BK III, CH 7 [306^a1-18] 397b-c / *Meteorology*, BK I, CH 7 [344^a5-9] 450b
 10 HIPPOCRATES: *Ancient Medicine*, par I 1a-b / *Prognostics*, par I 19a-b; par 25 26a,c
 16 PTOLEMY: *Almagest*, BK III, 83a; BK IX, 270b-273a; BK XIII, 429a-b
 16 COPERNICUS: *Revolutions of the Heavenly Spheres*, 505a-506a
 16 KEPLER: *Epitome*, BK IV, 852a-b; 888b-890b; 911a-b; 929a; BK V, 964b
 18 AUGUSTINE: *Confessions*, BK V, par 4 27d-28a
 19 AQUINAS: *Summa Theologica*, PART I, Q 32, A 1, REP 2 175d-178a
 28 GILBERT: *Loadstone*, BK VI, 119a-b
 28 HARVEY: *Circulation of the Blood*, 316a-b
 30 BACON: *Novum Organum*, BK II, APH 18, 149d; APH 36, 165d-166a
 31 DESCARTES: *Discourse*, PART VI, 66a-b
 32 MILTON: *Paradise Lost*, BK VIII [66-84] 233b-234a
 34 NEWTON: *Principles*, BK III, GENERAL SCHOL, 371b-372a / *Optics*, BK I, 379a
 34 HUYGENS: *Light*, PREF, 551b-552a; CH I, 553a-b
 35 LOCKE: *Human Understanding*, BK IV, CH III, SECT 16 317a-c; CH XII, SECT 13 362c-d
 35 BERKELEY: *Human Knowledge*, SECT 105 433b-c
 35 HUME: *Human Understanding*, SECT IV, DIV 26 460b-c; SECT IX, DIV 82 487b-c; SECT XI, DIV 107, 499d-500a
 36 STERNE: *Tristram Shandy*, 272b-273b
 38 ROUSSEAU: *Inequality*, 329d-330a; 333d-334a
 42 KANT: *Pure Reason*, 228b-c / *Science of Right*, 457a-b
 45 LAVOISIER: *Elements of Chemistry*, PART I, 9d-10a; PART II, 62a-63a
 45 FARADAY: *Researches in Electricity*, 850b,d-851c
 49 DARWIN: *Origin of Species*, 42a; 239c
 53 JAMES: *Psychology*, 357b; 367b [fn 5]; 655a; 862a-863a; 883a-884b
 54 FREUD: *General Introduction*, 483d-484a / *Group Psychology*, 686c-d / *New Introductory Lectures*, 840a-b

4c. Consistency, simplicity, and beauty as standards in the construction of hypotheses

- 16 PTOLEMY: *Almagest*, BK III, 93a; BK XIII, 429a-b
 16 COPERNICUS: *Revolutions of the Heavenly*

- Spheres*, 505a-506a; 507a-508a; BK IV, 675b-678a esp 677b-678a; BK V, 740a-b; 784b-785b
 16 KEPLER: *Epitome*, BK IV, 888b-890a; BK V, 984b-985b
 42 KANT: *Pure Reason*, 227d-228d / *Judgement*, 551a-553c
 45 LAVOISIER: *Elements of Chemistry*, PART II, 62a-63a
 53 JAMES: *Psychology*, 655a-659a esp 655a, 657b-658b
 54 FREUD: *Narcissism*, 400d-401a

4d. The task of verification: the plurality of hypotheses

- 6 HERODOTUS: *History*, BK II, 49a-c
 8 ARISTOTLE: *Heavens*, BK II, CH 14 387d-389d; BK III, CH 7 [306^a6-18] 397b-c
 10 GALEN: *Natural Faculties*, BK I, CH 14, 177a-178d
 11 ARCHIMEDES: *Sand-Reckoner*, 520a-b
 12 LUCRETIVUS: *Nature of Things*, BK VI [703-711] 89c-d
 16 PTOLEMY: *Almagest*, BK I, 9a-12b; BK III, 86b-93a; BK IV, 120a-122b

Chapter 37: IDEA

INTRODUCTION

AS the topical analysis or outline in each chapter indicates, the great ideas are not simple objects of thought. Each of the great ideas seems to have a complex interior structure—an order of parts involving related meanings and diverse positions which, when they are opposed to one another, determine the basic issues in that area of thought.

The great ideas are also the conceptions by which we think about things. They are the terms in which we state fundamental problems; they are the notions we employ in defining issues and discussing them. They represent the principal content of our thought. They are *what* we think as well as what we think *about*.

If, in addition to its objects and content, we wish to think about thought itself—its acts or processes—we shall find in the tradition of the great books a number of related terms which indicate the scope of such inquiry. Some of them are: idea, judgment, understanding, and reasoning; perception, memory, and imagination; sense and mind. Here we are concerned with one of these—the idea IDEA. It is probably the most elementary of all these related terms, for according to different conceptions of the nature and origin of ideas, the analysis of thought and knowledge will vary. Different positions will be taken concerning the faculties by which men know, the acts and processes of thinking, and the limits of human understanding.

Does the word “idea,” when it is used in the technical discourse of metaphysics or psychology, signify that which is known or understood? Does it signify, not the object of thought, but the thought itself? Or both? Certainly in popular speech the word is used both ways, for men speak of understanding an idea and note differences in their understanding of the same

idea; and they also say that they have different ideas about the same thing, meaning that they understand the same thing differently.

The word “idea” has many other oppositions of meaning in its tremendous range of ambiguity. It is sometimes used exclusively for the eternal types in the divine mind or the intelligible forms that exist apart from material things which are their copies; sometimes for concepts in the human mind, abstracted from sense-experience; sometimes for the seeds of understanding which belong innately to the intellect and so do not need to be derived from sense. Sometimes “idea” means a sensation or a perception as well as an abstract thought, and then its connotation extends to almost every type of mental content; sometimes it is denied that there are any abstract or general ideas; and sometimes “idea” has the extremely restricted meaning of an image which is the memory of a sense-impression.

Kant vigorously protests against what he thinks is a needless abuse of the term *idea*. “I beg those who really have philosophy at heart,” he writes, “to exert themselves to preserve to the expression *idea* its original signification.” There is, he insists, “no want of words to denominate adequately every mode of representation without encroaching upon terms which are proper to others.”

Kant proposes a “graduated list” of such terms. He begins with *perception*, which he divides into *sensation* and *cognition*, according as it is subjective or objective. A cognition, he then goes on, “is either an *intuition* or a *conception*,” according as it has either an immediate or a mediate relation to its object. Dividing conceptions into the *empirical* and the *pure*, Kant finally reaches the term *idea* as one sub-division of pure conceptions. If the pure conception “has its origin in the understanding

alone, and is not the conception of a pure sensuous image," it is a *notio* or notion; and "a conception formed from notions, which transcends the possibility of experience, is an *idea*, or a conception of reason."

According to Kant, anyone "who has accustomed himself to these distinctions," will find it "quite intolerable to hear the representation of the color red called an idea." Tolerable or intolerable, the word "idea" has been used quite persistently with the very meaning that Kant abominates, as well as with a variety of others. The reader of the great books must be prepared for all these shifts in meaning and, with them, shifts in doctrine; for according to these differences in meaning, there are different analyses of the nature or being of ideas, different accounts of their origin or their coming to be in the human mind, and different classifications of ideas. These three questions—what ideas are, how ideas are obtained, and of what sorts they are—are so connected that the answer given to one of them tends to circumscribe the answers which can be given to the other two.

THE UNITY OF EACH chapter in this guide to the great books depends on some continuity of meaning in its central term, some common thread of meaning, however thin or tenuous, which unites and makes intelligible the discussions of various authors about the same thing. Without this, they would not move in the same universe of discourse at all. Nor could they even disagree with one another, if the words they used were utterly equivocal, as for example the word "pen" is equivocal when it designates a writing instrument and an enclosure for pigs.

The extraordinary ambiguity of the word "idea" as it is used in the great books puts this principle to the test. Are Plato and Hume talking about the same thing *at all*, when the one discusses ideas as the only intelligible reality and the other treats ideas as the images derived through memory from the original impressions of sense-experience? Is there any common ground between Aristotle and Berkeley—between the identification of human ideas with abstract or general conceptions, quite distinct from the perceptions or images of sense, and the

identification of ideas with particular perceptions, accompanied by a denial of abstract or general notions?

Do writers like Locke or William James, for whom ideas of sensation and abstract ideas (or percepts and concepts) belong to the one faculty of understanding or to the single stream of consciousness, communicate with writers like Plotinus, Descartes, and Spinoza, for whom ideas belong to the intellect or to the thinking being, separate from matter and from sensations which are only bodily reactions? Or with writers like Aristotle and Aquinas, for whom there is a sharp distinction between the faculties of sense and intellect? Can Aristotle and Aquinas in turn explain the origin of concepts or intelligible species by reference to the intellect's power of abstracting them from experience or sensible species, and still carry on discussion with Plato, Augustine, and Descartes, who regard the intellect as in some way innately endowed with ideas, with the principles or seeds of understanding?

The foregoing is by no means an exhaustive inventory. It fails, for example, to ask about the sense in which the theologians speak of ideas in the mind of God and of the illumination of the angelic or the human intellect by ideas divinely infused. (What is the common thread of meaning between such discourse and that concerned with the formation of abstract concepts or with the revival of sense-impressions in images?) It fails also to question the meaning of idea in Kant's tripartite analysis of the faculties of intuition, judgment, and reasoning; or in Hegel's ultimate synthesis of all nature and history in the dialectical life of the Absolute Idea. (What do these meanings of "idea" have in common with the sense in which Freud distinguishes between conscious and unconscious ideas?)

The inventory is also incomplete in that it does not indicate the many divergent routes taken by authors who seem to share a common starting point. Even those who, on certain points, seem to talk the same language, appear to have no basis for communication on other points in the theory of ideas. But the questions which have been asked suffice for the purpose at hand. However great the ambiguity of "idea," it does not reach that limit of equivoca-

tion which would destroy the universe of discourse. There is a slender thread of meaning which ties all the elements of the tradition together—not in a unity of truth or agreement, but in an intelligible joining of issues.

This unity can be seen in two ways. It appears first in the fact that any consideration of ideas—whether as objects or contents of the mind—involves a theory of knowledge. This much is common to all meanings of “idea.”

Those, like Plato and Berkeley, for whom ideas constitute a realm of intelligible or sensible being, make knowledge of reality consist in the apprehension or understanding of ideas. Those, like Aristotle and James, for whom ideas have no being except as perceptions or thoughts, make them the instruments whereby reality is known. On either view, knowledge involves a relationship between a knower and a known, or between a knowing faculty and a knowable entity; but on one view ideas are the reality which is known, and on the other they are the representations by which is known a reality that does not include ideas among its constituents. These two views do not exhaust the possibilities.

Ideas are sometimes regarded both as objects of knowledge and as representations of reality. Some writers (as, for example, Plato) distinguish two orders of reality—the sensible and the intelligible—and two modes of apprehension—sensing and understanding; and they use the word “idea” for both the intelligible object and the understanding of it. Locke, begging the reader’s pardon for his frequent use of the word “idea,” says that it is the term “which serves best to stand for whatsoever is the object of the understanding when a man thinks.” But Locke also distinguishes between knowledge of real existences through ideas “that the mind has of things as they are in themselves,” and knowledge of the relations among our own ideas, which the mind “gets from their comparison with one another.” For Hume, too, ideas as well as impressions are involved in our knowledge of matters of fact, but relations between ideas may also be objects of knowledge, as in “the sciences of geometry, algebra, and arithmetic.”

This double use of “idea” is sometimes accompanied, as in Aquinas, by an explicit ac-

knowledge and ordering of the two senses. For Aquinas, concepts are primarily the means of knowledge, not the objects of knowledge. A concept, Aquinas writes, “is not *what* is actually understood, but *that by which* the intellect understands”—that by which something else is known. Secondly, however, concepts become *that which* we know when we reflexively turn our attention to the contents of our own mind. Using the phrase “intelligible species” to signify concepts, Aquinas explains that “since the intellect reflects upon itself, by such reflection it understands not only its own act of intelligence but also the species by which it understands. Thus the intelligible species is that which is understood secondarily; but that which is primarily understood is the object, of which the species is the likeness.”

It is possible, therefore, to have ideas about things or ideas about ideas. In the vocabulary of this analysis by Aquinas, the ideas or concepts whereby real things are understood are sometimes called the “first intentions” of the mind. The ideas whereby we understand these ideas or first intentions are called the mind’s “second intentions.” An idea is always a mental intention, an awareness or representation, never an independent reality for the mind to know.

Locke’s differentiation between ideas of sensation and ideas of reflection seems to parallel the mediaeval distinction between first and second intentions; but whereas second intentions are ideas engaged in a reflexive understanding of ideas as objects to be understood, Locke’s ideas of reflection comprise “the perception of the operations of our own mind within us, as it is employed about the ideas it has got.” A closer parallel, perhaps, is to be found in Locke’s distinction between our knowledge of reality or of real existences and our knowledge of the relations existing between our own ideas.

THE SECOND WAY of seeing a connection among meanings of “idea” depends on recognizing what is common to contrary views.

The word “pen” is utterly equivocal, as we have noted, when it names a writing instrument and an animal enclosure. Hence men

cannot contradict one another no matter what opposite things they may say about *pens* in one sense and *pens* in the other. The two meanings of "pen" are not even connected by being opposed to one another. But all the meanings of "idea" do seem to be connected by opposition at least, so that writers who use the word in its different senses and have different theories of idea cannot avoid facing the issues raised by their conflicting analyses.

The root of this opposition lies in the positive and negative views of the relation of ideas to sensations—or, more generally, to sense and the sensible. Though there are different analyses of sensation, one or both of two points seems to be agreed upon: that sensations are particular perceptions and that sensations result from the impingement of physical stimuli upon the sense organs of a living body.

Berkeley insists upon the first point while emphatically denying the second. Ideas or sensations are always particulars; but, he says, "the various sensations or ideas imprinted on the sense, however blended or combined together (that is, whatever objects they compose), cannot exist otherwise than in a mind perceiving them," and their cause is neither physical matter nor the perceiving mind, but "some other will or spirit that produces them." Others, like Lucretius and Hobbes, who regard sensations as particular perceptions, do not use the word "idea," as Berkeley does, for perceptions of external origin, but restrict it to inner productions of the mind itself in its acts of memory or imagination.

The various theories of idea thus range from those which identify an idea with a sensation or perception or with the derivatives of sensation, to those which deny the identity or even any relationship between ideas and sensations or images of sense.

THE FIRST POSITION is taken by writers who conceive mind or understanding, in men or animals, as the only faculty of knowledge. It performs all the functions of knowing and thinking. It is sensitive as well as reflective. It perceives and remembers as well as imagines and reasons.

Within this group of writers there are differences. Berkeley, for example, thinks "the ob-

jects of human knowledge" include "either ideas actually imprinted on the senses; or else such as are perceived by attending to the passions and operations of the mind; or lastly ideas formed by the help of memory and imagination—either compounding, dividing, or barely representing those originally perceived in the aforesaid ways." Hume, on the other hand, divides "all the perceptions of the mind into two classes or species, which are distinguished by their different degrees of force or vivacity. The less forcible and lively are commonly denominated *Thoughts* or *Ideas*. The other species want a name in our language and in most others . . . Let us, therefore, use a little freedom and call them *Impressions*." By this term, Hume explains, "I mean all our more lively perceptions, when we hear, or see, or feel, or love, or hate, or desire, or will."

Another use of terms is represented by Locke, who distinguishes between ideas of sensation and reflection, simple and complex ideas, particular and general ideas, and uses the word "idea" both for the original elements of sense-experience and for all the derivatives produced by the mind's activity in reworking these given materials, whether by acts of memory, imaginative construction, or abstraction. Still another variation is to be found in William James. Despite the authority of Locke, he thinks that the word "idea" has not domesticated itself in the language so as to cover bodily sensations." Accordingly, he restricts the word "idea" to concepts, and never uses it for sensations or perceptions. Nevertheless, like Locke, he does not think that the development of concept from percept needs the activity of a special faculty. Both concept and percept belong to the single "stream of thought" and are "states of consciousness."

THE SECOND POSITION is taken by writers who in one way or another distinguish between sense and intellect and regard them as quite separate faculties of knowing. The one is supposed to perform the functions of perception, imagination, and memory; the other, the functions of thought—conception, judgment, and reasoning, or if not these, then acts of intellectual vision or intuition. Here, too, there are differences within the group.

Just as the extreme version of the first position is taken by those who identify ideas with perceptions, so here the opposite extreme consists in the denial of any connection between ideas and all the elements of sense-experience. The ideas in the divine mind, or the ideas infused by God into the angelic intellects, have no origin in experience, nor any need for the perceptions, memories, or images of sense. They are not abstract ideas, that is, they are not concepts abstracted from sense-materials.

"Our intellect," Aquinas writes, "abstracts the intelligible species from the individuating principles"—the material conditions of sense and imagination. "But the intelligible species in the divine intellect," he continues, "is immaterial, not by abstraction, but of itself." The divine ideas, Aquinas quotes Augustine as saying, "are certain original forms or permanent and immutable models of things which are contained in the divine intelligence." Following Augustine's statement that "each thing was created by God according to the idea proper to it," Aquinas restricts the word "idea" to the "exemplars existing in the divine mind" and to the species of things with which God informs the angelic intellects. He uses the word "concept" where others speak of "ideas" in the human mind.

Descartes, on the other hand, endows the human mind with ideas—not concepts abstracted from and dependent on sense, but intuitive apprehensions which, since they cannot be drawn in any way from sense-experience, must be an innate property of the human mind. He does not, however, always use the word "idea" in this strict sense. Some ideas, he says, "appear to be innate, some adventitious, and others to be formed or invented by myself." The ideas called "adventitious" are those which seem to come from the outside, as when "I hear some sound, or see the sun, or feel heat." Those which we form or invent ourselves are "constructions of the imagination." Only innate ideas, in Descartes' view, are truly ideas in the sense of being the elements of certain knowledge and the sources of intellectual intuition. "By intuition," he says, "I understand, not the fluctuating testimony of the senses, nor the misleading judgment that proceeds from the blundering constructions of the imagination,"

but "the undoubting conception of an unclouded and attentive mind" which "springs from the light of reason alone."

As mind and body are separate substances for Descartes—mind being conceived by him as a *res cogitans* or thinking substance, quite separate from a *res extensa* or the extended matter of a bodily substance—so ideas and sensations are independent in origin and function. Like infused ideas in the angelic intellect, innate ideas in the human mind are not abstract, for they are not abstracted. But unlike the angelic intellect, the human mind, even when it employs innate ideas, is discursive or cogitative. It is never conceived as entirely free from the activities of judgment and reasoning, even when its power is also supposed to be intuitive—that is, able to apprehend intelligible objects without analysis or without recourse to the representations of sense.

The doctrine of innate ideas does not always go as far as this in separating intellectual knowledge—or knowledge by means of ideas—from sense-experience. In the theories of Plato and Augustine, for example, sense-experience serves to awaken the understanding to apprehend the intelligible objects for the intuition of which it is innately equipped.

"To learn those things which do not come into us as images by the senses," Augustine writes, "but which we know within ourselves without images . . . is in reality only to take things that the memory already contains scattered and unarranged . . . and by thinking bring them together." Moreover, the memory contains, not only "images impressed upon it by the senses of the body, but also the notions of the very things themselves, which notions we never received by any avenue of the body."

This process of learning by remembering appears to be similar to the process which Plato also calls "recollection" or "reminiscence." In the *Meno* Socrates demonstrates that a slave-boy, who thinks he knows no geometry, can be led simply by questioning to discover that he knew all the while the solution of a geometric problem. "There have always been true thoughts in him," Socrates tells Meno, thoughts "which only needed to be awakened into knowledge by putting questions to him." Hence "his soul must always have possessed this knowledge."

Learning, according to this doctrine of innate ideas, must therefore be described as an attempt "to recollect," not "what you do not know," but "rather what you do not remember."

Learning by recollection or reminiscence seems to be a process in which latent ideas (whether they are retained by the soul from a previous life or are part of the soul's endowment at its creation) become active either through the questioning of a teacher or through being awakened by the perceptions of the bodily senses. Though such bodily stimulation of thought implies a functional connection between body and soul, nevertheless both Plato and Augustine hold that ideas are independent in origin. They are not derived from sense, though their appearance may be occasioned by events in the world of sense.

ONE OTHER VIEW still remains to be considered. It denies that ideas are innate in the human mind at the same time that it distinguishes between the intellect and the senses as separate faculties of knowing. Having to explain whence the intellect gets its ideas, writers like Aristotle and Aquinas attribute to the human intellect an abstractive power by which it draws "the intelligible species" from sensory images, which Aquinas calls "phantasms."

The concepts by which "our intellect understands material things," we obtain "by abstracting the form from the individual matter which is represented by the phantasms." Through the universal concept thus abstracted, we are able, Aquinas holds, "to consider the nature of the species apart from its individual principles." It should be added here that abstractions are not vehicles of intuitive apprehension. Conception, which is the first act of the mind, yields knowledge only when concepts are used in subsequent acts of judgment and reasoning.

Abstract or universal concepts are as different from the ideas which belong to intellects separate from bodies—the divine or angelic intellects—as they are different from the particular perceptions or images of sense. They occupy an intermediate position between the two, just as, according to Aquinas, "the human intellect holds a middle place" between angelic intelli-

gence and corporeal sense. On the one hand, the human intellect is for Aquinas an incorporeal power; on the other hand, it functions only in cooperation with the corporeal powers of sense and imagination. So the concepts which the human intellect forms, being universal, are immaterial; but they are also dependent, in origin and function, on the materials of sense. Not only are universal concepts abstracted from the phantasms, but for the intellect to understand physical things, "it must of necessity," Aquinas writes, "turn to the phantasms in order to perceive the universal nature existing in the individual."

This theory of abstract ideas seems not far removed from the position of Locke, who distinguishes between particular and general ideas (which he calls "abstract") or that of William James, who distinguishes between universal concepts and sense-perceptions. Yet on one question the difference between them is radical, namely, whether particular sensations and universal ideas belong to the same faculty of mind or to the quite distinct faculties of sense and intellect.

This difference seems to have considerable bearing on the way in which these writers explain the process of abstraction or generalization, with consequences for certain subtleties, acknowledged or ignored, in the analysis of the grades of abstraction. Nevertheless, the resemblance between the positions of Locke and Aquinas, or those of William James and Aristotle, each affirming in his own way that the mind contains nothing not rooted in the senses, serves to mediate between the more extreme positions.

THE DISPUTE ABOUT innate ideas and the controversy over abstract ideas are issues in psychology inseparable from fundamental differences concerning the nature and operation of the faculty or faculties of knowing. There are other issues which concern the being or the truth of ideas. Here the first question is not whether ideas are objects of knowledge, but whether the existence of ideas is real or mental—outside the mind or in it.

One aspect of this controversy is considered in the chapter on FORM, *viz.*, the argument between Aristotle and Plato about the being of

the Ideas or Forms apart from both matter and mind. It is in the context of this argument that the traditional epithet "realism" gets one of its meanings, when it signifies the view that ideas or universals have an independent reality of their own. The various opponents of this view are not called "idealists." If they deny any existence to universal ideas outside the mind, they are usually called "conceptualists"; if they deny the presence of universals even in the mind, they are called "nominalists." These doctrines are more fully discussed in the chapters on SAME AND OTHER, UNIVERSAL AND PARTICULAR.

The controversy about the being of ideas has another phase that has already been noted in this chapter; and it is in this connection that the epithet "idealism" gets one of its traditional meanings. The doctrine is not that ideas have real existence outside the mind. On the contrary, it is that the only realities are mental—either minds or the ideas in them.

Berkeley's famous proposition—*esse est percipi*, to be is to be perceived—seems intended to permit only one exception. The perceiving mind has being without being perceived, but nothing else has. Everything else which exists is an idea, a being of and in the mind. According to this doctrine (which takes different forms in Berkeley and in Hegel, for example), the phrase "idea of" is meaningless. Nothing exists of which an idea can be a representation. There is no meaning to the distinction between thing and idea. The real and the ideal are identical.

Plato is sometimes called an "idealist" but not in this sense. He has never been interpreted as completely denying reality to the changing material things which imitate or copy the eternal ideas, the immutable archetypes or Forms. Applied to Plato or to Plotinus, "idealism" seems to signify the superior reality of ideal (as opposed to material or physical) existence. Just as "idealism" has these widely divergent meanings, so does "realism" when it designates, on the one hand, those who attribute independent reality to ideas and, on the other hand, those who affirm the existence of an order of real existences independent of the ideas which represent them in the mind.

Writers who distinguish between things and ideas, or between the order of reality and the

mind's conception of it, face the problem of differentiating between these two modes of being. To say that ideas or concepts exist only in the mind is not to say that they do not exist at all, but only that they do not exist in the same way as things outside the mind.

Does an entity in its real existence apart from knowledge have the same character that it has when, as an object known, it somehow belongs to the knowing mind? Is there a kind of neutral essence which can assume both modes of existence—real existence, independent of mind, and ideal existence, or existence in the mind, as an object conceived or known? Is an idea or concept in the mind nothing but the real thing objectified, or transformed into an object of knowledge; or is the real thing, the thing in itself, utterly different from the objects of experience or knowledge—neither knowable nor capable of representation by concepts?

These questions, relevant to the consideration of ideas as representations of reality, are, of course, also relevant to problems considered in the chapters on BEING, EXPERIENCE, and KNOWLEDGE. The issues indicated are there discussed.

Intimately connected with them are questions about the truth of ideas. Can ideas or concepts be true or false in the sense in which truth and falsity are attributed to propositions or judgments? Under what conditions is an idea true? In what does its truth consist, and what are the signs or marks of its truth? These matters are discussed in the chapter on TRUTH. Here it is sufficient to point out that the traditional distinction between adequate and inadequate ideas, and the comparison of clear and distinct with obscure and confused ideas, are used to determine the criteria of truth. It may be the truth of a concept taken by itself or of the judgment into which several concepts enter. To the extent that ideas are regarded as representative, their truth (or the truth of the judgments they form) seems to consist in some mode of agreement or correspondence with the reality they represent, or, as Spinoza says, its *ideatum*.

Within the conceptual or mental order itself, there is a further distinction between ideas which do not perform a representative function and those which do. The former are treated as

fantasies, fictions, or chimeras; the latter are called, by contrast, "real ideas," or ideas having some reference to reality. The question of the reality of ideas takes precedence over the question of their truth, at least for those who regard the division into true and false as applicable only to representations. Yet the criteria of the distinction between the real and the imaginary are difficult to separate from the criteria of true and false. The separation is made most readily by those who use "idea" to mean memory image. They can test the reality of an idea by tracing it back to the impression from which it originated.

Another sort of test is applied by those who measure the reality of abstract ideas by their fidelity to the sense-perceptions from which they were abstracted. Still another criterion, proposed by William James, is that of freedom from contradiction. An idea has truth and its object has reality if it "remains uncontradicted." The idea of a winged horse illustrates the point.

"If I merely dream of a horse with wings," James writes, "my horse interferes with nothing else and has not to be contradicted. . . . But if with this horse I make an inroad into the world otherwise known, and say, for example, 'That is my old mare Maggie, having grown a pair of wings where she stands in her stall,' the whole case is altered; for now the horse and place are identified with a horse and place otherwise known, and what is known of the latter objects is incompatible with what is perceived with the former."

THE CONSIDERATION of ideas or concepts belongs to logic as well as to psychology and metaphysics. The logician sometimes deals with concepts directly and with the judgments into which they enter; sometimes he deals with them only as they find verbal expression in terms and propositions.

The distinction between concepts and judgments (or between terms and propositions) is discussed in the chapter on JUDGMENT. There also we see that the classification of judgments or propositions depends in part on the acceptance or rejection of the notions of subject and predicate in the analysis of concepts or terms; and, if they are accepted, on the way in which

terms are distinguished both as subjects and as predicates.

This in turn depends upon certain traditional divisions which are applicable to terms, if not always to concepts, such as the familiar distinctions between concrete and abstract, and particular and universal, terms. When the concept, which is sometimes called the "mental word," is regarded as by its very nature abstract and universal, these distinctions are applicable only to the physical words which are terms. Concrete and particular terms are then treated as verbal expressions of sense-perceptions or images; abstract and universal terms, as verbal expressions of ideas or concepts. But when ideas are identified with sense-perceptions or images, and abstract concepts are denied, the existence of general names in ordinary discourse suffices for the distinction between particular and universal terms, even though the latter do not express any actual content of the mind.

Unlike the foregoing, other divisions of terms, as, for example, the distinction between the univocal and the analogical, or between species and genera, do not occur throughout the tradition of logic. They tend to be characteristic of the logic of Aristotle and its mediaeval development. Of these two distinctions, that between univocal and analogical terms or concepts appears explicitly, so far as this set of great books is concerned, only in the *Summa Theologica*. Nevertheless, Aquinas does have some background for his special theory of analogical terms in Aristotle's treatment of univocal and equivocal names, and in his separation of terms which predicate a sameness in species or genus from those which predicate a sameness by analogy. The analysis of these distinctions is undertaken in the chapters on SAME AND OTHER and SIGN AND SYMBOL.

Other writers, in dealing with universal terms, recognize that they have different degrees of generality. They sometimes formulate this as an order of more and less inclusive classes. Sometimes they refer to the intension and extension, or connotation and denotation, of terms. The more general terms have a less restricted connotation and hence represent more extensive or inclusive classes. The more specific terms have a more determinate meaning and so also have a narrower denotation and represent

less inclusive classes. What seems to be peculiar to Aristotle's analysis of species and genera is the setting of upper and lower limits to the hierarchy of universal terms, with a small number of irreducible categories (or *summa genera*) under which all species fall, and, at the other extreme, with a finite number of lowest (or *infimae*) species which are incapable of subsuming other species.

The terms which fall under the lowest species must either be particulars or accidental classes. Those which seem to be predicable of the categories themselves, such as *being* or *one*, cannot be genera. These are the terms which Aristotle's mediaeval followers call "transcendental" and "analogical." Using the word "transcendental" in a different sense, Kant enumerates a set of concepts which bear some resemblance to Aristotle's *summa genera*, but which he treats as transcendental categories.

The difference among concepts with respect to generality is of interest to the psychologist as well as the logician, for it raises the problem

of whether the more or the less general takes precedence in the order of learning. The order and relation of ideas is even more the common ground of both logic and psychology. Both, for example, deal with the position and sequence of terms or concepts in reasoning, though the logician aims to *prescribe* the forms which reasoning must take in order to be valid, whereas the psychologist tries to *describe* the steps by which thinking actually goes on.

Only the logician, however, is concerned with the way in which terms are ordered to one another as positive and negative, or as contraries; just as from Aristotle to Freud, only the psychologist deals with the association of ideas in the stream of thought by relationships of contiguity and succession, similarity and difference. According as the logical connection of ideas or their psychological association is made the primary fact, radically divergent interpretations are given of the nature of mind, the life of reason, and the process of thought.

OUTLINE OF TOPICS

	PAGE
1. Doctrines of idea	771
1a. Ideas, or relations between ideas, as objects of thought or knowledge: the ideas as eternal forms	
1b. Ideas or conceptions as that by which the mind thinks or knows	772
1c. Ideas as the data of sense-experience or their residues	
1d. Ideas as the pure concepts of reason: regulative principles	
1e. Ideas in the order of supra-human intelligence or spirit: the eternal exemplars and archetypes; the modes of the divine mind	
1f. Idea as the unity of determinate existence and concept: the Absolute Idea	773
2. The origin or derivation of ideas in the human mind	
2a. The infusion of ideas: divine illumination	
2b. The innate endowment or retention of ideas: the activation of the mind's native content or structure by sense, by memory, or by experience	
2c. The acquirement of ideas by perception or intuition: simple ideas or forms as direct objects of the understanding	
2d. Reflection as a source of ideas: the mind's consideration of its own acts or content	774
2e. The genesis of ideas by the recollection of sense-impressions: the images of sense	
2f. The production of ideas by the reworking of the materials of sense: the imaginative construction of concepts or the formation of complex from simple ideas	

- 2g. The abstraction of ideas from sense-experience: the concept as the first act of the mind; the grades of abstraction 775
- 2h. The derivation of transcendental ideas from the three syllogisms of reason
- 3. The division of ideas according to their objective reference
 - 3a. Ideas about things distinguished from ideas about ideas: the distinction between first and second intentions
 - 3b. Adequate and inadequate ideas: clear and distinct ideas as compared with obscure and confused ideas 776
 - 3c. Real and fantastic or fictional ideas: negations and chimeras
- 4. The logic of ideas
 - 4a. The verbal expression of ideas or concepts: terms
 - 4b. The classification of terms: problems in the use of different kinds of terms 777
 - (1) Concrete and abstract terms
 - (2) Particular and universal terms
 - (3) Specific and generic terms: *infimae species* and *summa genera*
 - (4) Univocal and analogical terms 778
 - 4c. The correlation, opposition, and order of terms
- 5. Ideas or concepts in the process of thought
 - 5a. Concept and judgment: the division of terms as subjects and predicates; kinds of subjects and predicates
 - 5b. The position and sequence of terms in reasoning 779
 - 5c. The dialectical employment of the ideas of reason
 - 5d. The order of concepts in the stages of learning: the more and the less general
 - 5e. The association, comparison, and discrimination of ideas: the stream of thought or consciousness
- 6. The being and truth of ideas
 - 6a. The distinction between real and intentional existence, between thing and idea: ideas as symbols, or intentions of the mind
 - 6b. The nature and being of ideas in relation to the nature and being of the mind 780
 - 6c. The agreement between an idea and its object: the criterion of adequacy in correspondence 781
 - 6d. Clarity and distinctness in ideas as criteria of their truth
 - 6e. The criterion of genesis: the test of an idea's truth or meaning by reference to its origin
 - 6f. The truth and falsity of simple apprehensions, sensations, or conceptions: contrasted with the truth and falsity of judgments or assertions

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265–283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a–119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b–164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265–283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation “esp” calls the reader’s attention to one or more especially relevant parts of a whole reference; “passim” signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Doctrines of idea

1a. Ideas, or relations between ideas, as objects of thought or knowledge: the ideas as eternal forms

- 7 PLATO: *Cratylus*, 113c–114a,c / *Phaedrus*, 125a–126d / *Symposium*, 167a–d / *Euthyphro*, 193a–c / *Phaedo*, 224a–c; 228d–230c; 231c–232a; 242b–243c / *Republic*, BK III, 333b–334b; BK V, 368c–373c; BK VI, 383d–388a; BK VII, 392b–393b; 397a–398c / *Timaeus*, 455c–458b / *Parmenides* 486a–511d / *Theaetetus*, 534d–536a / *Sophist*, 571a–574c / *Statesman*, 595a–c / *Philebus*, 610d–613a / *Seventh Letter*, 809c–810d

Chapter 38: IMMORTALITY

INTRODUCTION

THE mortality of man defines by contrast the immortality which some men hope for, some men fear, some men scoff at, but no man ever fails sooner or later to consider. The life of man, like that of other animals, moves through a normal span of years between birth and death. Legend tells of certain heroes upon whom the immortal gods bestowed immortal life, gracing them with an aspect of their own divinity. Jewish and Christian faith holds that Adam, with all his posterity, would never have suffered disease or death if he had refrained from sin. But according to the theologians, the imperishability of the bodily frame of man in a state of grace is a preternatural condition. Except, then, for the miraculous or the supernatural, death follows birth and life, that which comes to be passes away, all things of flesh and blood perish.

The proposition "All men are mortal" has been repeated during centuries of lessons in logic. Its truth has never been seriously challenged even by those who have criticized the syllogism which reaches the conclusion that since he is a man, Socrates is mortal. But throughout the same period, the great books of poetry and religion, of philosophy and theology, have recorded the qualifications which men have placed upon this truth.

Man dies in the flesh to be reborn in the spirit. Man, composite of soul and body, perishes as do all things which are subject to dissolution; but the soul itself, a simple spiritual substance, is immortal, living on after its union with the body is dissolved. The immortal soul is sometimes conceived as having many incarnations, inhabiting now this body, now that, in an endless pilgrimage through endless time; and sometimes, as in the Christian faith, each soul has only one embodiment on earth. It is specially created by God to inform the body of a human

being. It is destined to be his immortal spirit in a future which belongs to eternity rather than to time.

Except for the form it takes in the doctrine of reincarnation, or the transmigration of souls, the idea of immortality is usually attended by conceptions of an after-life in another world—the life of the shades in the Elysian Fields or in Hades, the life of the blessed in Heaven or of the damned in Hell. The after-life is never merely a continuation of the life begun on earth. The other world is not just an abode for the disembodied soul. It is a place of judgment, of rewards and punishments, in which the soul realizes the good, or pays the penalty for the evil, toward which its earthly career inclined. The connection of immortality with rewards and punishments appears even in the theory of reincarnation, for as the soul passes from one embodiment to another, it enjoys or suffers the consequences befitting its previous existence.

STATED AS A speculative problem, the question of immortality is traditionally formulated as a question about the soul or the spirit of man: whether it exists by itself either before or after its conjunction with a human body; and if so, in what manner it subsists. For those who affirm the soul's separate existence, there seems to be no question about its everlasting endurance, either without beginning at all or from the moment of its creation. But the manner of the soul's subsistence leads to speculation concerning an after-life or an other-life in a world of spirits, or in realms as far apart as Heaven and Hell.

We shall presently consider to what extent such speculations have been submitted to argument and to what extent they have been matters of religious belief. But in both these modes

of consideration, the theme of immortality is never merely a matter of speculative interest, never merely a question of spiritual substances and their subsistence. It is always a problem for the moralist.

Is this earthly life and its brief temporal span enough for the aspirations of the human spirit, and for its striving toward a perfection of knowledge, of love, and of repose? If external sanctions are needed to support the voice of conscience, are earthly rewards and punishments—either humanly dispensed, or capriciously distributed by chance or fortune—sufficient sanction for the moral law? Can perfect justice be done unless there is a divine law and a divine judge, a judge who can see beyond the acts of men into their hearts, from whose judgment no one escapes, and whose rewards and punishments are supernaturally established states of blessedness and misery for the soul?

Whether or not God, freedom, and immortality are, as Kant suggests, the three great objects of speculative thought, they do seem to form the basic triad of religious beliefs. In the religions of the west, these beliefs take various forms, but the belief in immortality is seldom if ever found separate from belief in a supernatural order, in gods or a God to whom man owes certain duties and before whom man stands to be judged as a responsible moral agent who was free to obey or disobey the divine commands. But, this fact admitted, the question remains whether the principles of morality can be adequately stated, or made effective in the regulation of human conduct, without a religious foundation, or at least without reference to God and immortality.

On this the moralists disagree. The argument in Plato's *Gorgias*, for example, about whether it is better to do or suffer injustice, ends with a myth which tells of the soul standing naked before its divine judge after a man's death, showing no marks of the evil the individual has suffered during his life, but only of the evil he has done. The reader who thinks the myth is necessary to complete the argument concerning justice and punishment, takes one position on the question. He adopts the view that without the judgment of souls in an after-life justice cannot be done.

The preoccupation with immortality in a

great many of Plato's dialogues is not always based upon moral considerations. It appears as frequently in discussions of the relation between the soul and the objects of its knowledge. If, to be proper objects of knowledge, the Ideas must be eternal, the soul which knows them must also be immortal. But when the discussion of immortality involves a comparison of this life and the life to come, it usually turns on considerations of goodness rather than of knowledge and truth. For Kant, if not for Plato, immortality is almost entirely a moral matter; and where the Platonic myth deals with just rewards and punishments in an after-life, the Kantian argument is concerned with the achievement of moral perfection.

In his *Critique of Practical Reason*, Kant affirms immortality, along with the existence of God and the freedom of the will, as necessary practical postulates—indispensable conditions of the moral life. "The perfect accordance of the will with the moral law," Kant writes, "is *holiness*, a perfection of which no rational being of the sensible world is capable at any moment of his existence . . . It can only be found in a progress *in infinitum* towards that perfect accordance . . . It is necessary to assume such a practical progress as the real object of our will." The realization of happiness, or the *summum bonum*, Kant concludes, "is only possible practically on the supposition of the immortality of the soul."

The opposite view appears to be taken in Aristotle's *Ethics* and Mill's *Utilitarianism*. The *summum bonum* is a temporal happiness, a perfection attainable on earth and by purely natural means. In those passages in which Aristotle defines happiness in terms of contemplative activity, he also speaks of it as a godlike life and therefore one which has a touch of immortality. Man is able to lead such a life, he writes, only "in so far as something divine is present in him." To lead the life of reason, which is divine in comparison with any other mode of human life, we must, he says, "so far as we can, make ourselves immortal, and strain every nerve to live in accordance with the best thing in us."

But to be immortal in this way seems to mean the possession of a godlike quality in this life rather than the promise of a life hereafter.

Aristotle demands only "a complete term of life" as a necessary condition for "the complete happiness of man." He passes lightly over the question whether "the dead share in any good or evil." So far as he considers a *blessedness* which the gods can add to human happiness, it does not belong to an after-life, but consists rather in the good fortune which the gods grant to some men and which increases and secures their happiness beyond that which is attainable by virtue alone.

The moral issue concerning immortality is more explicitly faced by Mill in his examination of the need for religious or supernatural sanctions. While he does not admit their indispensability, neither does he deny their utility. "There is evidently no reason," he declares, "why all these motives for observance should not attach themselves to the utilitarian morality, as completely and as powerfully as to any other." Yet he himself stresses "the possibility of giving to the service of humanity, even without the aid of belief in a Providence, both the psychological power and the social efficacy of a religion."

Mill does not go as far as Lucretius in regarding the belief in immortality, with the attendant possibility of everlasting torment for the soul, as itself an immoral doctrine. For Lucretius it is a nightmare which haunts the waking hours of men, filling them with false fears and putting future pains in the way of present pleasures. He dedicates his poem to "driving headlong forth that dread of Acheron, troubling as it does the life of man from its inmost depths and overspreading all things with the blackness of death, allowing no pleasure to be pure and unalloyed."

Where others see in man's fear of death his natural desire for immortality, Lucretius thinks it is the dread of immortality which causes man's fear of death. "We have nothing to fear after death," he says, if death is the end. "He who exists not, cannot become miserable."

IN THE GREAT POEMS of antiquity we find the imagery and detail of the pagan conception of the life hereafter. Both Odysseus and Aeneas visit the underworld. They see the shades of the departed heroes; all that is visible to the bodily eye are shimmering wraiths. They talk with the

departed, listen to their memories, or hear them speak prophetically of the future. From Anchises, his dead father, Aeneas learns his destiny; and Odysseus hears in Hades what has befallen his companions at Troy and his family at home during his years of wandering.

Yet there is a striking difference between Virgil's poem and Homer's with respect to the after-life. The division which Virgil makes between Elysium and Tartarus corresponds much more closely than anything in Homer—or for that matter in the other Greek poets—to the Christian distinction between Heaven and Hell. Though Elysium and Tartarus both belong to the underworld, one is the abode of the blessed, the other a place of torment for sinners.

In the sixth book of the *Aeneid*, the Sibyl explains the topography of the underworld to Aeneas. There is a place "where splits the road in twain," she says:

The right leads to the giant walls of Dis,
Our way to Elysium; but the left wreaks doom
On sinners, and to guilty Tartarus sends.

Tartarus, the abode of the condemned, is surrounded by "a fierce torrent of billowy fire," and is filled with the noise of punishment. Elysium, on the other hand, is

The happy region and green pleasaunces
Of the blest woodlands, the abode of joy.
An ampler ether with purpureal light
Clothes here the plain; another sun than ours,
And other stars they know.

Its inhabitants, in sharp contrast with the unfortunates in Tartarus, seem to pass their time in peace and pleasure.

Homer makes no such sharp division between the realm of the blessed and the realm of the condemned. Plutarch speaks of "the isles of the blessed celebrated by Homer," but the reference cannot be substantiated. In one passage in the *Iliad* Menelaus is promised that he will be taken "to the Elysian plain, which is at the end of the world. There fair-haired Rhadamanthus reigns, and men lead an easier life than anywhere else in the world, for in Elysium there falls not rain, nor hail, nor snow." But even this seems to describe a different life rather than an after-life.

So far as the underworld is described on the occasion of Odysseus' descent "into the house

of Hades and dread Prosperine," we are told that the Theban prophet Teiresias alone has his "reason still unshaken." All "the other ghosts flit about aimlessly." The shades of good men and bad alike languish in the domain of darkness. Tityus, Tantalus, and Sisyphus are subjected to special punishments for their grievous sins and transgressions, but all the shades—even of those men whom the gods loved and honored—seem to be in a state of misery. Though they are not all beset with torments and agonies, none seems to be overcome with joy or to have reached contentment.

Those whom the gods love do not join the deities on Mount Olympus. When they enter the somber realm of Pluto—the deity of the underworld—they, like all the other shades whom Charon ferries across the river Styx, are more remote from the gods than are mortal men on earth. The only exception perhaps is Heracles, whom Odysseus meets in Hades, or rather "his phantom only, for he is feasting ever with the immortal gods, and has lovely Hebe to wife."

The general attitude of all who dwell in the underworld is summed up by Achilles when he tells Odysseus: "Say not a word in death's favor; I would rather be a paid servant in a poor man's house and be above ground than king of kings among the dead." And the mother of Odysseus describes the condition of the dead "in the abode of darkness" as one in which "the sinews no longer hold the flesh and bones together; these perish in the fierceness of consuming fire as soon as life has left the body, and the soul flits away as though it were a dream."

Among other ancient peoples such as the Egyptians, the Babylonians, and the Persians, Herodotus found other views of immortality than those which prevailed in Greece. He reports, for example, the doctrine of transmigration or reincarnation—a doctrine which also appears in the myth of Er at the end of Plato's *Republic* and is alluded to elsewhere in the Platonic dialogues. "The Egyptians," Herodotus writes, "were the first to broach the opinion that the soul of man is immortal, and that, when the body dies, it enters into the form of an animal which is born at the moment, thence passing on from one animal into another, until it has circled through the forms of all creatures

which tenant the earth, the water, and the air, after which it enters again into a human frame and is born anew."

Herodotus, however, seems more interested in the effect of such beliefs on the practices of the living, especially their funeral rites and other devotions, than he is with the truth of conflicting theories of immortality.

"The doctrine of a future state," according to Gibbon, "was scarcely considered among the devout polytheists of Greece and Rome as a fundamental article of faith." Before the time of Christ, "the description of the infernal regions had been abandoned to the fancy of painters and of poets, who peopled them with so many phantoms and monsters who dispensed their rewards and punishments with so little equity, that a solemn truth, the most congenial to the human heart, was oppressed and disgraced by the absurd mixture of the wildest fictions." Lacking an acceptable or satisfying belief, yet inclined to believe in, as men are inclined to hope for, a better life, the pagan world, Gibbon thinks, could not long resist the appeal of Christian teaching. "When the promise of eternal happiness was proposed to mankind on condition of adopting the faith, and of observing the precepts of the Gospel, it is no wonder," he declares, "that so advantageous an offer should have been accepted by great numbers of every religion, of every rank, and of every province in the Roman empire."

THE ARGUMENTS for personal immortality which Christian theologians draw from the nature of the human soul do not differ essentially from the proofs offered by philosophers without recourse to religious faith. This applies to arguments advanced before Christianity by Plato and Plotinus as well as to those developed by philosophers like Descartes and Locke who belong to the Christian community. The exclusively theological aspects of the Christian doctrine of immortality are those matters which, since they are beyond the reach of reason, belong to faith alone.

The doctrine that the individual soul is created and that it has a unique affiliation with one human body, is not capable of being proved or defended by reason against the quite opposite theory that the soul has always existed and

inhabits any number of bodies in the course of many reincarnations. The existence of Hell, Purgatory, and Heaven as supernatural states of the soul; the time, place, and manner of the Last Judgment; the resurrection of the body and the difference between the bodies reunited with the souls of the blessed and the damned; the joy of eternal happiness and the misery of eternal damnation—these dogmas of Christian orthodoxy go far beyond all merely philosophical attempts to prove the soul's immortality or to consider its life apart from the body.

The great theologians undertake to do more than expound these articles of faith. Reason asks questions which the man of faith must try to answer, defending his faith, not by proof, but by overcoming doubts, by answering objections, by making dogmas intelligible. Yet the great theologians admit an irreducible core of mystery. The joy of the soul united to God in the beatific vision surpasses temporal understanding. The mysteries of Hell are perhaps even greater.

The deprivation of God's love and exclusion from His presence constitute a spiritual misery comparable to the beatitude of beholding God and being within the circle of the divine light. One is an infinite anguish of frustration and loss; the other, an infinite rest of peace and fulfillment. But the theologians also teach that the damned suffer the pains of sense in Hell, as well as the pains of deprivation. "That hell, which also is called a lake of fire and brimstone," Augustine says, "will be material fire and will torment the bodies of the damned." When hell-fire and the expiatory punishments of Purgatory are not merely symbols for the imagination, they raise extraordinarily difficult questions, as both Augustine and Aquinas admit.

Dante asks us to read the descriptions he gives of Hell, Purgatory, and Paradise in the *Divine Comedy* in a strictly literal sense as well as in several symbolic meanings, such as the moral and the allegorical. But he explains in his own commentary on the poem that the literal meaning also involves symbolism, insofar as the things that the words refer to when taken in their literal sense are themselves the symbols of other things. In any case the poet may be more successful than the theologian in making intelligible through symbol and metaphor what

in its literal significance is strictly unimaginable. The imagery of darkness, sultriness, noise, and heaviness, which grows more intense as the descent proceeds in the *Inferno*, does more than the anguished outcries of the damned to convey the reality of Hell.

The metaphors of music and agility express the harmony of Heaven. But it is especially the symbolism of light which captures the invisible in terms of vision, except perhaps when it reaches a climax in the blinding effulgence at the end of the *Paradiso*. As Dante moves upward in the realm of love, where courtesy prevails in every speech and charity suffuses every will, he sees the mystic rose of Heaven entirely through reflected light. The saints, and especially those glorious spirits who instruct his progress, become pale mirrors of the ineffable vision which they themselves behold.

Milton too pictures Heaven and Hell, but in *Paradise Lost* the destiny of the immortal soul remains a prophecy, a consequence of the earthly immortality which Adam lost. Except for the Prologue, Hell and Heaven are offstage in Goethe's *Faust*, though they are the main implications of the wager Faust makes with Mephistopheles, which puts his immortal soul in the balance.

THE PHILOSOPHICAL issue concerning immortality cannot be separated from issues concerning the existence and nature of man's soul. The various arguments for immortality seem to rest not merely on the reality of the distinction between soul and body, but more precisely on the immateriality of the soul. Lucretius, for example, does not deny the existence of soul, nor does he fail to differentiate the soul from the body wherein it is located. The soul, according to Lucretius, like everything else in the universe, consists of atoms. They differ from those of the body by their roundness, smoothness, and mobility. They are "much smaller than those of which our body and flesh are formed; they are also much fewer in number and are disseminated merely in scanty number through the frame."

On this view of the soul as material in nature and as constituted of many quite separable parts, the soul is necessarily as perishable as the rest of the body. "When the body has been

shattered by the mastering might of time," Lucretius writes, "and the frame has drooped with its forces dulled . . . it naturally follows then that the whole nature of the soul is dissolved, like smoke, into the high air; since we see it is begotten along with the body and grows up along with it and . . . breaks down at the same time worn out with age."

It should be observed, however, that it is not the materiality of the soul, but rather its divisibility into parts, which accounts for its mortality. The atoms after all are material, but since as the ultimate units of matter they are simple bodies and so are absolutely indivisible, they cannot perish. Only the simple is imperishable.

The *imperishability of the simple* (i.e., of that which has no parts) occurs as a premise in one of the great arguments for the immortality of the soul. In Plato's *Phaedo*, which formulates this argument as immortality is discussed in the prison cell where Socrates awaits his execution, two assumptions seem to be made: first, that the soul is the principle of life in animate bodies, for, as Socrates says, "whatever the soul possesses, to that she comes bearing life"; and second, that as an immaterial being, the soul must be simple, for only bodies are "composite" and "changing."

From the first of these assumptions, the argument proceeds in terms of what it means for bodies to be alive or dead. Socrates argues from examples. "If any one asks you," he says, "what that is, of which the inherence makes the body hot, you will reply not heat . . . but fire. . . . Or if any one asks you why a body is diseased, you will not say from disease, but from fever." So if any one asks, "what is that of which the inherence will render the body alive?" the answer is not life but "the soul." As the principle of life itself, the soul "will never receive the opposite of what she brings," namely, death. Therefore the soul is immortal.

On the second assumption, the endless duration of the soul follows from its simplicity as an immaterial and immutable being. "The compound or composite," Socrates says, "may be supposed to be naturally capable, as of being compounded, so also of being dissolved; but that which is uncompounded, and that only, must be, if anything is, indissoluble." When the

soul leaves the body, for which it has been both motor and pilot, the body ceases to be alive and perishes in the manner of material things; the soul lives on, freed from temporary bondage to the body, its prison house. It "departs to the invisible world—to the divine and immortal and rational."

The argument from simplicity, as repeated in Moses Mendelssohn's *Phädon*, is criticized by Kant. Admitting that a truly "simple being cannot cease to exist," Kant contends that the *knowable* soul—which is for him the empirical ego or consciousness—may have intensive, though it lacks extensive, quantity. It would therefore be capable of diminution in reality; and so it "can become less and less through an infinite series of smaller degrees."

With regard to the soul as an immaterial and simple substance (i.e., the transcendental ego), Kant is willing to affirm that immortality necessarily belongs to such a nature. But he denies that we can have any knowledge of the soul except as a phenomenon of experience. There can be no valid theoretic argument for immortality precisely because there can be no scientific knowledge of the nature of transcendental objects—beings beyond all possible experience. What Kant calls "the paralogisms of rational psychology" are offered to show the dialectical futility of proofs or disproofs of immortality, in the same way that "the cosmological antinomies" attempt to expose the untenability of arguments for or against the infinity of time and space, the infinite divisibility of matter, the existence of a free will and of God.

Without deciding whether Kant's theory of experience and knowledge is true, this much we can learn from him about the issue of immortality. Those philosophers who, like Descartes and Locke, think they have grounds for affirming the existence of the soul (or mind or spirit) as an immaterial substance, also have grounds for affirming its immortality. Those who, like Lucretius and Hobbes, think they have grounds for denying the existence of anything except material particles, also have grounds for denying either the existence of the soul or its having a permanence not possessed by other material wholes. And those who, like Hume, think there are no grounds for affirming the existence of any kind of enduring substance, material or

spiritual—even to the point of doubting personal identity from moment to moment—can admit no grounds for affirming a substantial, much less an immortal, soul.

ONE OTHER POSITION remains to be considered. Though it does not fall outside the foregoing alternatives, Aristotle's theory represents an important variation on one of them. As against Hume or Kant, Aristotle holds that substances exist and are knowable. The sensible, material things of experience are such substances. But, according to Aristotle, these substances are not *exclusively* material. They are composed of two principles, matter and form, neither of which is a substance capable of existing by itself. As the exposition of this theory (in the chapters on FORM and MATTER) tries to make plain, form and matter exist only in union with one another. It is the composite substance resulting from their union which exists in and of itself.

The form which enters into the composition of a substance can be called its "substantial form." In relation to the matter with which it is united, the substantial form is the actualization of the potentiality in matter to exist as a substance of a certain kind. Not all substances are of the same kind. Some are alive; some inanimate and inert. In the case of living substances, the substantial form, according to Aristotle, confers upon matter not only the act of existing as a substance, but also the act of being alive. Because it thus differs from the form of an inanimate substance, Aristotle gives a special name to the substantial form of a living thing. Because the word "soul" has long been used to designate "the principle of life in living things," Aristotle feels justified in using it as the name for the substantial forms of plants and animals as well as men.

This theory and its principal opposite (which regards the human soul as a complete substance, not a substantial form) are more fully discussed in the chapter on SOUL. Here we are concerned only with the consequences of Aristotle's theory for human immortality. If, as he seems to hold, substantial forms exist only insofar as they exist in the substances of which they are the forms, then when a composite substance perishes through the decomposition of its matter and

form, the form perishes also. Souls—the substantial forms of living things—would seem to be no exception. "The soul," Aristotle writes, "is inseparable from its body, or at any rate certain parts of it are (if it has parts)—for the actuality of some of them is nothing but the actualities of their bodily parts. Yet some may be separable because they are not the actualities of any body at all."

The exception which Aristotle seems to have in mind is that part of the human soul which is the intellect. It differs from other powers of the soul, he suggests, as the eternal from the perishable. "It alone," he says, "is capable of existence in isolation from all other psychic powers." He argues that "in so far as the realities it knows"—or at least some of them—"are capable of being separated from their matter, so is it also with the power of the mind."

What is the significance, for the immortality of the human soul, of the supposed ability of the intellect to act independently of the body? Aristotle answers in terms of the principle that "if there is any way of acting or being acted upon proper to soul, soul will be capable of separate existence; if there is none, its separate existence is impossible." If we consider nutrition, sensation, and emotion, there seems to be, he admits, "no case in which the soul can act or be acted upon without involving the body." The one possible exception may be thinking, but Aristotle adds at once that "if this too proves to be a form of imagination or to be impossible without imagination, it too requires a body as a condition of its existence."

Later, when he is discussing the power of thought, Aristotle flatly insists that "the soul never thinks without an image" and that "no one can learn or understand anything in the absence of sense," for "when the mind is actively aware of anything it is necessarily aware of it along with an image." According to his own principles it would seem to follow that since thinking proves "to be impossible without imagination, it too requires a body as a condition of its existence." Hence the intellect is not separable from matter, nor is the human soul, of which the intellect is the highest power.

Nevertheless, Aristotle declares, in a passage which has become famous, that mind as the active power of thinking "is separable, im-

passible, unmixed"; and with this declaration of the intellect's separability from matter, he seems to affirm immortality, at least for the intellectual part of the soul. "When mind is set free from its present conditions," he writes, "it appears as just what it is and nothing more: this alone is immortal and eternal."

THE PASSAGES QUOTED have been subject to conflicting interpretations. The Arabic commentators on Aristotle, notably Averroes, find in them no basis for the immortality of the individual human soul. The texts, according to their view, support the theory of a *single* active intellect which exists apart from the minds of individual men—almost a divine principle in the universe which, acting on the rational souls of individual men, enables them to think and understand. Aquinas argues against them to the opposite conclusion.

Against the Averroists Aquinas contends that if the individual man, Socrates, can be said to think, then whatever powers are required for thinking must belong to his individual nature. The powers required for thinking are, according to Aquinas, twofold: an active intellect, able to abstract the intelligible forms of things from their material representation in sensory images; and a possible or potential intellect, capable of receiving these forms when separated from matter by the act of abstraction.

The theory of knowledge and thought which this involves is discussed in the chapters on FORM, IDEA, MIND, and UNIVERSAL AND PARTICULAR. Here we are concerned only with the point which Aquinas makes, that since thinking involves universal notions, and since forms can be universal only apart from matter, the intellect which abstracts and receives abstractions must itself be immaterial. The intellectual powers do not operate through a bodily organ, as the power of nutrition operates through the alimentary system or the power of vision through the eye. The brain, in other words, is not the organ of understanding or thought, but rather, along with the external sense-organs, it is the material organ of perception, memory, and imagination.

The argument for the immortality of the human soul then proceeds on the premise that that which can *act* apart from matter can also

exist apart from matter. "The intellectual principle which we call the mind or the intellect has an operation *per se* apart from the body. Now only that which subsists can have an operation *per se*, for nothing can operate but what is actual; wherefore a thing operates according as it is." Hence Aquinas concludes that "the human soul, which is called the intellect or mind, is something incorporeal and subsistent." The attribution of subsistence to the human soul means that although it is the substantial form of the human body, it is also capable of existing in and of itself as if it were a simple substance.

Unlike angels, which as spiritual substances are by their very nature *separate* forms, not forms of matter, human souls are substantial forms which, having a certain degree of immateriality, are also to that degree separable from matter. But the reverse is also true. To the extent that the soul's powers, such as sensation and imagination, require corporeal organs, the soul is inseparable from the body. Since, furthermore, Aquinas agrees with Aristotle that every act of understanding or thought involves imagination, he faces the difficulty of explaining how the soul can function in any way when separated from the body after death.

"To solve this difficulty," he says, "we must consider that as nothing acts except as it is actual, the mode of action in every agent follows from its mode of existence. Now the soul has one mode of being when in the body, and another when apart from it. . . . The soul, therefore, when united to the body, has consistently with that mode of existence, a mode of understanding by turning to corporeal images, which are in corporeal organs; but when it is separated from the body, it has a mode of understanding by turning to simply intelligible objects, as is proper to other separate substances." Nevertheless, Aquinas adds, it is not natural for the soul to understand in the latter way, for it is not by nature a separate substance. Therefore, "to be separated from the body is not in accordance with its nature."

THIS LAST POINT has both philosophical and theological significance. Philosophically, it may be easier to prove the immortality of the soul if one starts, as the Platonists do, with the proposition that the soul is a purely spiritual prin-

ciple or substance which does not depend upon the body. But then, according to Aquinas, you prove the immortality of the soul at the expense of destroying the unity of man, for if the soul is a substance rather than a form, the individual man, composed of body and soul, consists of two distinct substances.

Theologically, Christian faith believes in the resurrection of the body after the Last Judgment and the end of the world, as well as in the soul's separate existence immediately after death. From the point of view of a theologian like Aquinas, a philosophical proof of immortality must corroborate both of these dogmas. In his judgment a proof which rests upon the proposition that the soul has a nature akin to that of an angel (*i.e.*, a purely spiritual substance), makes the Christian dogma of the resurrected body unintelligible or even abhorrent.

If the immortal soul were a complete and separate substance, it would have no need for its body in the life hereafter. It has that need only if its nature is that of a substantial form, partly immersed in matter and partly separate therefrom. Then, because of these two aspects of its nature, it can be said, not only that "the human soul retains its proper existence when separated from the body," but also that it has "an aptitude and a natural inclination to be united to the body."

The incompleteness of the soul without the body and, even more, the dependence of man's mind upon his bodily senses and imagination raise, as we have seen, the difficult problem of how the soul exists and operates when separated from the body by death and before it is reunited to a resurrected body. It may even raise the question whether the reasoning of Aquinas constitutes a valid philosophical argument for the actual existence of the soul in separation from the body, or merely suggests the possibility of such existence. But the facts which create these difficulties are the very facts to which Aquinas appeals in his *Treatise on the Resurrection*, in order to explain the basis in nature for the miraculous re-union of the body with the soul.

THE ARGUMENTS FOR and against immortality so far considered are couched in the form of proofs or disproofs which aim at certainty. All

except one are, moreover, theoretical or speculative in the sense that they proceed in terms of observations, assumptions, and inferences about the nature of things—about atoms and substances, matter and form, extension and thought, inert bodies and living organisms. The one exception, already mentioned, is Kant's practical argument based on the moral necessity of an immortal life.

There is still another argument, both speculative and practical in character, which does not aim at certainty nor take the form of a proof. It is the proposal of a wager concerning the equally unknown alternatives of oblivion after death and eternal life. Supposing no rational evidence to favor the truth of either alternative, Pascal weighs the probability of gain and loss which is consequent upon living according to each hypothesis. The probability, he thinks, vastly preponderates on the side of those who choose to forego the worldly life because, to take the chance of gaining the whole world during the short term of earthly life, they would risk the loss of eternal happiness for their immortal souls.

Locke engages in the same type of calculation. "When infinite happiness is put into one scale, against infinite misery in the other; if the worst that comes to the pious man, if he mistakes, be the best that the wicked can attain to, if he be right, who," Locke asks, "can without madness run the venture? Who in his wits would choose to come within the possibility of infinite misery; which if he miss, there is yet nothing to be got by that hazard? Whereas, on the other side, the sober man ventures nothing against infinite happiness to be got, if his expectation comes to pass." If, wagering on immortal life, "the good man be right, he is eternally happy"; but "if he mistakes"—if death ends all—"he is not miserable, he feels nothing."

ALL THESE THEORIES, including Kant's postulate and the wager proposed by Pascal and Locke, are clearly concerned with arguing for personal immortality or individual survival. Among those who deny the survival of the individual human spirit, some—Hegel and Spinoza, for example—conceive an impersonal type of immortality.

For Hegel it is Spirit itself which is immortal. "The successive phases of Spirit that animate the Nations in a necessitated gradation," he writes, "are themselves only steps in the development of the one Universal Spirit, which through them elevates and completes itself to a self-comprehending totality." In considering the history of the world, he regards everything as the manifestation of Spirit; and because of this, even when we traverse the past, we have, he says, "only to do with what is *present*; for philosophy, as occupying itself with the True, has to do with the *eternally present*. Nothing in the past is lost for it, for the Idea is ever present; Spirit is immortal; with it there is no past, no future, but an essential now. This necessarily implies that the present form of Spirit comprehends within it all earlier steps. . . . The grades which Spirit seems to have left behind it, it still possesses in the depths of its present."

What Spirit is for Hegel, Nature is for Spinoza. Spinoza, however, conceives a kind of immortality for the individual man, which is achieved through his participation in the eternity of Nature. The body of the individual man, according to Spinoza, belongs to the infinite matter of Nature. It is "a certain mode of extension actually existing." The individual human mind is similarly "a part of the infinite intellect of God." In one sense, both the body and the mind are temporal things which, like all other finite modes of God or Nature, have a fixed and limited duration. Furthermore, the personal memories and thoughts of the individual man depend on the co-existence of his mind and body. "The mind can imagine nothing, nor can it recollect anything that is past," Spinoza writes, "except while the body exists."

But Spinoza also maintains that "only in so far as it involves the actual existence of the body, can the mind be said to possess duration, and its existence be limited by a fixed time." Of every individual thing—whether it is a finite mind or a finite body—there exists in the infinite and eternal essence of God a conception or idea. "To conceive things under the form of eternity," Spinoza writes, "is to conceive them in so far as they are conceived through the essence of God." Because he holds that the human mind can have adequate knowledge of God, he holds that the mind can conceive "it-

self and its body under the form of eternity." Hence through knowing God, or the eternal truth about temporal things, the mind participates in eternity.

Imagination and memory may belong to time, but not the intellect, which is capable of knowing God. To explain why we feel "that we are eternal," Spinoza points out that "the mind is no less sensible of those things which it conceives through intelligence than of those which it remembers." Although we cannot *imagine* or *remember* that "we existed before the body," we can *know intellectually* something about mind and body which belongs to eternity; because, in addition to conceiving them as "existing with relation to a fixed time and place," we can conceive them as "contained in God" and as following "from the necessity of the divine nature." Since it "pertains to the nature of the mind to conceive the essence of the body under the form of eternity," Spinoza concludes that "the human mind cannot be absolutely destroyed with the body, but something of it remains which is eternal."

Such immortality is, in a way, enjoyed in this life, for it is a present participation in eternity through the mind's knowledge of God. There is also the impersonal immortality which men enjoy through contemplating the perpetuation of the species, or more particularly the persistence of an image of themselves in their offspring. In the *Symposium*, Socrates reports a conversation with Diotima in which she explains to him that in procreation "the mortal nature is seeking as far as is possible to be everlasting and immortal." Men hope that offspring "will preserve their memory and give them the blessedness and immortality which they desire in the future." But if procreation through the pregnancy of the body is a way of achieving immortality, artistic creation through a kind of pregnancy in the soul, Diotima argues, is even more so. "Who, when he thinks of Homer and Hesiod and other great poets," she asks, "would not rather have their children than ordinary ones? Who would not emulate them in the creation of children such as theirs, which have preserved their memory and given them everlasting glory?"

One need think "only of the ambition of men" and what they will do "for the sake of

leaving behind them a name which shall be eternal," to realize how deeply "they are stirred by the love of an immortality of fame." Even deeper, according to Diotima, is their love of the good, or more precisely, their desire for "the everlasting possession of the good" which leads all men necessarily to "desire immortality together with the good."

Whether it is to be attained through the perpetuation of the species, through survival in the memory of mankind, through knowledge of God, or through the subsistence of the soul, the desire for immortality seems to express

man's dread of disappearance into utter nothingness. Yet, facing death, Socrates faces the alternatives with equanimity. "Either death," he declares, "is a state of nothingness and utter unconsciousness, or, as men say, there is a change and migration of the soul from this world to another." Either it is like a dreamless and undisturbed sleep or it opens a new world to which the good man can look forward with hope. On either alternative we can be of good cheer, he tells his friends, if we believe that "no evil can happen to a good man, either in life or after death."

OUTLINE OF TOPICS

PAGE

1. The desire for immortality: the fear of death	795
2. The knowledge of immortality: arguments for and against personal survival	796
3. Belief in immortality	
3a. The postulation of immortality: practical grounds for belief in immortality	797
3b. The revelation of immortality: immortality as an article of religious faith	
4. The moral significance of immortality: rewards and sanctions	
5. Conceptions of the after-life	798
5a. The transmigration of souls: reincarnation	
5b. The state of the soul apart from the body	799
5c. The judgment of souls	
5d. The process of purification: the state of Purgatory	
5e. The state of the damned: Hell	800
5f. The state of the blessed: Heaven	
5g. The resurrection of the body	801
6. Doctrines of impersonal survival	
6a. Immortality through offspring: the perpetuation of the species	
6b. Enduring fame: survival in the memory	802
6c. Participation in the eternity of truth, ideas, or love	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The desire for immortality: the fear of death

OLD TESTAMENT: *II Samuel*, 22:5-7—(D) *II Kings*, 22:5-7 / *Job*, 14; 30:23-24 / *Psalms*, 6 esp 6:4-5; 13 esp 13:3; 16 esp 16:10; 18:4-6; 49:6-12; 55 esp 55:4-8; 89:47-48; 116:1-9—(D) *Psalms*, 6 esp 6:5-6; 12 esp 12:4; 15 esp 15:10; 17:5-7; 48:7-13; 54 esp 54:5-9; 88:48-49; 114 / *Ecclesiastes*, 8:8 / *Isaiah*, 38:10-19—(D) *Isaiah*, 38:10-19

APOCRYPHA: *II Maccabees*, 6:18-7:42 esp 7:9—(D) OT, *II Machabees*, 6:18-7:42 esp 7:9

NEW TESTAMENT: *Matthew*, 10:28; 19:16-30 / *Mark*, 10:17-31 / *Luke*, 10:25-37 / *Acts*, 7:54-60—(D) *Acts*, 7:54-59 / *Romans*, 2:5-8 esp 2:7 / *I Corinthians*, 15 / *II Corinthians*, 1:9-10; 4:9-18; 5:1-9 / *I Thessalonians*, 4:13-17—(D) *I Thessalonians*, 4:12-17 / *I Timothy*, 6:11-19 esp 6:12, 6:19 / *II Timothy*, 4:6-8 / *Hebrews*, 2:14-15

4 HOMER: *Iliad*, BK XII [309-328] 85b-c / *Odyssey*, BK V [203-224] 210a-b

Chapter 39: INDUCTION

INTRODUCTION

AS the list of Additional Readings indicates, the theory of induction falls within the province of logic and is part of the logician's concern with the methods of inference or reasoning employed in the sciences. The great controversies about induction seem to be of relatively recent origin in the history of logic, beginning perhaps with the argument between William Whewell and J. S. Mill over the contributions of reason and experience to the inductive process. Later in the nineteenth century and in our own time, writers like Johnson and Keynes, Russell and Nicod, who present different formulations of inductive inference, call attention to the unsolved problems with which any theory is left. They underline the assumptions that seem to be unavoidable in any statement of the formal conditions which validate the so-called "inductive leap"—the jump from observed particulars to general truths, truths having a wider generality than the particular evidences from which they are drawn or on which they are based.

The problem of induction, in anyone's version of it, is the problem of generalization. This may involve psychological questions about how the mind generalizes from experience. But however they are answered, the basic logical questions remain substantially unaltered. By what criteria is valid distinguished from fallacious induction? Can induction be secured from error by rules of inference? Is induction indispensable in the development of scientific knowledge, or is there, as Whewell, for example, suggests, a sharp distinction between the inductive and the deductive sciences?

What is the relation of induction to deduction? Is it the relation of a method of discovery to a method of demonstration or proof? Is it a relation between two modes of reasoning, both of which can be formulated as processes of

proof? Is there both an inductive and a deductive type of syllogism, or is induction the very opposite of all forms of reasoning and proof?

It is with these last questions that the discussion of induction begins in the great books, especially in Aristotle's *Organon* and Bacon's *Novum Organum*, but also in the writings of Descartes and Locke, and in observations on scientific method by Newton, Harvey, and Pascal. Though many of the controversies and problems which become central in the nineteenth century do not appear explicitly in the earlier tradition, they are anticipated by the fundamental distinctions and issues which can be found in the earlier writers.

Bacon's dissatisfaction with Aristotle, for example, leads him to formulate specific rules for induction. Going further in the same general direction, Mill later develops his elaborate theory of inductive inference. We move in the opposite direction if we are guided by Aristotle's distinction between scientific and dialectical induction and by his way of setting induction off as the very opposite of reasoning. The question then arises whether Bacon and Mill are treating induction in all or in only one of several quite distinct senses.

AS THE CHAPTER ON LOGIC indicates, the names of Aristotle and Bacon are sometimes used as the symbols of opposed tendencies in logic. The one is supposed to represent an almost exclusive emphasis on deduction, the other the primacy and importance of induction. An opposition between Aristotle and Bacon is also implied in the current use of such phrases as "inductive logic" and "deductive logic." These phrases are sometimes used to suggest that the inductive or the deductive process can be favored to the exclusion, or at least the subordination, of the other. Such understanding of

the matter usually includes the popular notion that induction is always reasoning from particulars to universals and deduction always reasoning from universals to particulars.

But none of these things seems to be true, or at least not without serious qualification. Neither Aristotle nor Bacon emphasizes deduction or induction to the exclusion of the other. On the contrary, both appear to insist on the absolute priority of induction, since, according to them, it provides deductive reasoning with its ultimate premises. Far from conflicting, induction and deduction complement each other. "The consilience of the results of both these processes," Mill writes, "each corroborating and verifying the other, is requisite to give to any general proposition the kind and degree of evidence which constitutes scientific proof."

Until principles are established, the deduction of their implications or consequences cannot begin. Unless principles, once they are obtained, are then used in the proof of other truths, or are otherwise rationally employed, the purpose of inductive generalization is not fully realized. In this understanding of the relationship between induction and reasoning, Aristotle and Bacon do not seem to disagree, nor does either of them conceive induction as a process of *reasoning* from particulars to universals.

There is no question that the direction of induction is from particulars; but in the precise sense in which induction precedes deduction—the sense in which both Bacon and Aristotle regard it as the source of axioms—they do not think it is a process of reasoning or a form of proof. As for deduction, it is questionable, at least for Aristotle, whether its direction can be described as from the universal to the particular.

Aristotle seldom uses the word "deduction" as the name for that phase of thought which is complementary to induction. He speaks rather of demonstration. Demonstration takes place through the various forms of reasoning which he calls "syllogisms." As the chapter on REASONING explains, these are collections of premises each of which yields a conclusion by valid inference. In the most perfect forms of reasoning, the conclusion is as universal as its premises, and though there are syllogisms in which a par-

ticular proposition can be demonstrated from a universal and a particular premise, it is seldom the case that from exclusively universal premises a particular conclusion can be validly drawn. The statement that deduction is reasoning from universals to particulars certainly does not seem to fit Aristotle's theory of the syllogism, and even less his conception of scientific demonstration, the aim of which is to prove universal, not particular, propositions.

"WE LEARN EITHER by induction or by demonstration," Aristotle writes in the *Prior Analytics*. "Demonstration develops from universals, induction from particulars." In the *Posterior Analytics* he says that the ultimate premises of demonstration must be primary or basic truths. A basic truth is an immediate proposition—what is sometimes called a "first principle" or an "axiom." Since in his view "an immediate proposition is one which has no other proposition prior to it," the basic premises cannot be demonstrated.

Whence come these primary premises which are indispensable to demonstration but which demonstration cannot establish? Aristotle's answer is that "we know the primary premises by induction." In another place he says, "it is by intuition that we obtain the primary premises."

The word "intuition" indicates an essential characteristic of the sort of induction which, because it is not itself a form of reasoning, can be prior to all reasoning and *must be*, in order to supply the premises from which reasoning proceeds. Reasoning is discursive. It is a process involving steps. One proposition is drawn from another by the mediation of a third. Intuition, in contrast, is immediate. Like an act of seeing, it apprehends its object at once and directly. When Aristotle speaks of induction as a kind of intuition, he implies, therefore, that it consists in the immediate grasp of a universal truth. The proposition thus held he calls "immediate" precisely because it can be known intuitively and in no other way. Intuitive induction, as opposed to what may be called "inductive reasoning," consists in seeing the universal in the particular. When what is seen is expressed in the form of a proposition, the universal implicit in the known particulars is made explicit.

Induction and intuition are, however, not identical for Aristotle. In one passage in the *Prior Analytics* he considers syllogistic induction, which can hardly be called "intuitive." And in the *Ethics*, where he discusses intuitive reason, he distinguishes between two sorts of primary truth that can be known by intuition.

"Intuitive reason," he writes, "is concerned with the ultimates in both directions; for both the first terms and the last are objects of intuitive reason and not of argument, and the intuitive reason which is presupposed by demonstrations grasps the unchangeable and first terms, while the intuitive reason involved in practical reasoning grasps the last and variable fact, *i.e.*, the minor premise. For these variable facts are the starting-points for the apprehension of the end, since the universals are reached from the particulars; of these therefore we must have perception, and this perception is intuitive reason."

This applies to theoretic as well as practical knowledge. By intuitive reason, it seems, we grasp both the universal principles or axioms and the particular facts of sense-perception. As perception is intuition on the part of the sensitive faculty, so induction is an intuitive use of the intellect (though Aristotle attributes both to "intuitive reason").

These two forms of intuition are functionally related. The induction of universal truths from particulars is impossible without sense-perception, "for it is sense-perception alone which is able to grasp the particulars." But, according to Aristotle, a single isolated perception does not give rise to an intuitive induction. Repeated perceptions of things of a certain sort—particulars of a certain class—are formed by memory into what he calls "an experience." Because the experience refers, not to a single individual, but to a class of similar individuals, it provides the material for the mind's intuitive act of induction.

This theory of the role of experience in induction is more fully discussed in the chapter on EXPERIENCE. For our present purposes, the main point is that the universal, lying implicitly in the experience, is ready, as it were, to be extracted therefrom and made explicit. "Though the act of sense-perception is of the particular, its content is universal," Aristotle writes. With

the help of memory and experience, induction makes the latent universal manifest.

BACON'S CRITICISM of the logic of Aristotle seems to rest on two counts: first, he complains of Aristotle's over-emphasis on syllogisms, whether they are used dialectically or demonstratively; and second, he charges Aristotle with a superficial understanding of induction. One of the chief efforts of the *Novum Organum* is to correct the latter mistake.

"There are and can exist," says Bacon, "but two ways of investigating and discovering truth. The one hurries on rapidly from the senses and particulars to the most general axioms, and from them, as principles, and from their supposed indisputable truth, deduces the intermediate axioms. This is the way now in use. The other constructs its axioms from the senses and particulars, by ascending continually and gradually, until it finally arrives at the most general axioms, which is the true but unattempted way."

Where Aristotle proposes that only the primary truths or first principles be established by induction, while all the others (which Bacon calls "intermediate axioms") are to be derived from them by demonstration, Bacon urges a method of induction which shall mount gradually from the least general to the most universal propositions. We should not "suffer the understanding to jump and fly from particulars to remote and most general axioms." We should "proceed by a true scale and successive steps, without interruption or breach, from particulars to the lesser axioms, thence to the intermediate (rising one above the other), and lastly, to the most general."

According to this theory, induction can intuitively draw more general from less general truths, as well as the least general truths from the particulars of perception. It might seem at first as if there were no place for deduction in the development of science. But Bacon divides the study of nature into two phases: "the first regards the eliciting or creating of axioms from experiments, the second the deducing or deriving of new experiments from axioms." Here too there seems to be a crucial difference between Bacon and Aristotle. This difference is indicated by Bacon's emphasis upon *experiments* both as

the source of inductive generalization and also as that which is ultimately derived by deduction from axioms.

The difference between *experience* (which Aristotle makes the source of induction) and *experiment* is more than verbal. "The axioms now in use," Bacon contends, "are derived from a scanty handful, as it were, of experience, and a few particulars of frequent occurrence." There has been too little attention given to negative instances, that is, of cases which seem to run counter to the generalization being formed. "In establishing any true axiom," Bacon insists, "the negative instance is the most powerful."

The chapter on EXPERIENCE dwells on the difference between ordinary experience and planned experiments. Where Aristotle seems to be satisfied with the ordinary experience which arises from the perceptions of men in the course of daily life, Bacon thinks it does not suffice. Because it is haphazard, it fails to collect the variety of instances, both positive and negative, upon which genuine and solid inductions can be founded. Unusual and special experiences must be sought out, and the effort must be made to invent experiences which do not arise spontaneously. For this, experiment—or the production of experiences—is necessary. Bacon thinks we must, "by every kind of experiment, elicit the discovery of causes and true axioms."

TWO CONSEQUENCES FOLLOW from the several differences we have noted between Aristotle's and Bacon's theories of induction.

In the first place, Aristotle does not seem to think that induction can be methodically prescribed by logical rules. It is a natural act of intelligence to draw universals from experience. Though men may differ in the readiness of their native wit, the induction of the primary truths, which are the axioms or first principles of science, does not require special genius nor can it be improved or rendered more certain by following rules. Precisely because it is intuitive rather than discursive, induction, unlike reasoning, cannot be regulated by rules of inference such as those which govern the syllogism.

Without disagreeing that it is intuitive rather than argumentative, Bacon seems to think

that induction requires the practice of the most detailed and precise method. Not only must the various ascending stages of induction be regulated by observance of an order of generality, but the making of experiments and the collection and arrangement of particulars, "forming tables and coordinations of instances," must be governed by a complex set of rules. The twenty-seven tables of instances, set forth in the second book of the *Novum Organum*, constitute the heart of Bacon's method of induction. This new method "of discovering the sciences," he observes, "levels men's wits and leaves but little of their superiority, since it achieves everything by the most certain rules."

In the second place, since genuine induction depends for Bacon upon ample experiments, it belongs primarily to the method of the experimental sciences—the physical or natural sciences in which experimentation is possible. Though the first principles or axioms of arithmetic and geometry may be learned by induction, the method of gradual ascent from experiments through intermediate generalizations does not apply to mathematics. Here we may have the beginning of the notion that only the experimental sciences are primarily inductive, whereas other sciences, like mathematics, are primarily deductive.

But such a division of the sciences does not accord with Aristotle's theory of induction. He thinks mathematics and metaphysics require induction for their foundation no less than physics and in no different way; if anything, induction is of the greatest importance for metaphysics, because all its principles are indemonstrable, whereas some of the principles needed in mathematics and physics can be demonstrated in metaphysics. Yet no science is peculiarly inductive, just as none stands in a special relation to experience. All depend equally upon experience for the induction of the primary truths on which their demonstrations rest.

Descartes seems to fall somewhere between Aristotle and Bacon. He regards arithmetic and geometry as more certain than the physical sciences, because mathematics is largely developed by deduction, whereas the study of nature depends upon induction from experiments. In this lies the superiority of mathematics. "While

our inferences from experience are frequently fallacious," Descartes writes, "deduction, or the pure illation of one thing from another . . . cannot be erroneous when performed by an understanding that is in the least degree rational."

Nevertheless, Descartes does not exclude induction as the source of the axioms of mathematics or, for that matter, of metaphysics; he only excludes the kind of induction which depends upon experiments. Such axioms as *when equals are taken from equals the remainders are equal* or *the whole is greater than any of its parts* are products of induction, as may be seen, he points out, from the fact that a child can be taught these general truths only "by showing him examples in particular cases." Similarly, the metaphysical truth in the proposition *I think; therefore, I exist* cannot be learned by deduction or syllogistic reasoning. The axiom that *to think is to exist* has to be learned by induction "from the experience of the individual—that unless he exists he cannot think. For our mind is so constituted by nature that general propositions are formed out of the knowledge of particulars."

FROM THE FOREGOING we can gather that different theories of induction may be, in large part, theories about different kinds of induction. Common to induction of every sort is the motion of the mind from particulars, apprehended by sense, to general propositions or universal notions. But the character of the induction, or its conditions and method, may differ according to the precise character of its source: (1) whether it arises from ordinary sense-experience or from planned experiments; and (2) whether it is based upon a single experiment or upon an enumeration of instances. There remains the most radical distinction in type of induction: (3) whether it is intuitive or discursive—accomplished by an act of immediate insight or by a process of reasoning from premises to a conclusion.

These three divisions cross one another to some extent. Descartes, for example, seems to regard the complete enumeration of a series of connected facts as a way of drawing a general conclusion about their connection. That he has inductive reasoning rather than intuitive induction in mind, we learn from his statement

that "by adequate enumeration or induction is meant that method by which we attain surer conclusions than by any other type of proof, with the exception of simple intuition."

Pascal seems to be making the same point when he says that "in all matters whose proof is by experiment and not by demonstration, no universal assertion can be made except by the general enumeration of all the parts and all the different cases." Bacon, on the other hand, always thinks of induction as intuitive generalization, and therefore maintains that "induction which proceeds by simple enumeration is puerile, leads to uncertain conclusions, and is exposed to danger from one contradictory instance."

The elaborate procedure which Bacon proposes for collating instances stresses, not completeness of enumeration, but an examination of their relation to one another and, in the light thereof, an interpretation of their significance. Mill's four or five methods of induction bear a close resemblance to Bacon's more numerous tables of instances; but Mill's methods are attempts to formulate the rules of inference for inductive reasoning, whereas Bacon's rules are rules, not of reasoning, but of tabulating the particulars from which intuitive generalizations can be formed.

On Mill's view of induction, it may be questioned whether induction from an exhaustive enumeration is induction at all, for it seems to result in a *summary* of the facts enumerated rather than a *generalization* from particulars. Where there is no inductive leap, there is no induction. Where the inductive leap does occur, however, it seems easier to understand it as an intuitive act—a seeing of the universal in the particular—rather than as a process of reasoning. Each of Mill's methods requires a rule of inference which is itself a universal proposition. His critics have asked, Whence come these universal propositions about the relations of cause and effect or about the order and uniformity of nature? They point out that he cannot answer that these propositions are themselves conclusions of inductive reasoning without begging the question.

SUCH CRITICISM of inductive reasoning does not seem to apply to Aristotle's conception of

it, for with him it is not, as with Mill, distinct in form from the syllogism. It is simply a distinct type of syllogism, which consists in reasoning from effect to cause rather than from cause to effect. Nor does the observation that an inductive inference cannot be more than probable apply to what Aristotle means by an inductive syllogism.

The certainty or probability of non-syllogistic induction depends on the source of the inference—whether it derives from a single specially constructed experiment or from an enumeration of particular instances, with or without a statistical calculation based on their frequency. The conception of a perfect experiment implies that the operation of a universal law can be exhibited in a single case. It is almost as if the controlling aim of the experiment were to make the universal manifest in the particular.

Newton's experiments on reflection and refraction seem to be of this sort. From them certain laws of optics are directly induced, even as, according to Aristotle and Descartes, the axioms of mathematics or metaphysics can be directly induced from simple experiences, available to a child or familiar to all men. Yet Newton does not think that the inductive establishment of such laws is as certain as demonstration.

The analytic method, he writes, "consists in making experiments and observations and in drawing general conclusions from them by induction. And although the arguing from experiments and observations by induction be no demonstration of general conclusions; yet it is the best way of arguing which the nature of things admits of, and may be looked upon as so much stronger, by how much the induction is more general. If no exception occur from phenomena, the conclusion may be pronounced generally; but if at any time afterwards any exception shall occur from experiments, it may then begin to be pronounced with such exceptions as occur."

Because it must depend on inductive generalizations from experience which, in his view, can never be certain, Locke doubts that physics can ever become a science. "I deny not," he writes, "that a man, accustomed to rational and regular experiments, shall be able to see further into the nature of bodies and guess righter at their yet unknown properties, than one that is a

stranger to them; but yet, as I have said, this is but judgment and opinion, not knowledge and certainty. This way of *getting and improving our knowledge in substances only by experience and history*, which is all that the weakness of our faculties in this state of mediocrity . . . can attain to, makes me suspect," Locke concludes, "that *natural philosophy is not capable of being made a science.*"

Hume offers two reasons for the inconclusiveness and uncertainty which he thinks qualify all our generalizations or inductions from experience. The first calls attention to the fact that, unlike mathematical reasoning, inferences from experience in the realm of physical matters depend on the number of cases observed. "The conclusions which [reason] draws from considering one circle," he says, "are the same it would form upon surveying all the circles in the universe. But no man, having seen only one body move, after being impelled by another, could infer that every other body will move after a like impulse."

The principle "which determines him to form such a conclusion" is, according to Hume, "Custom or Habit"; and precisely because inductive generalization is an effect of custom rather than of reasoning in the strict sense, the strength of the induction—or the force of custom—varies with the number of cases from which it arises. "After the constant conjunction of two objects—heat and flame, for instance, weight and solidity—we are determined by custom alone to expect the one from the appearance of the other. This hypothesis," Hume maintains, "seems . . . the only one which explains the difficulty, why we draw, from a thousand instances, an inference which we are not able to draw from one instance, that is in no respect different from them. Reason is incapable of any such variation."

Since *all* the relevant cases can never be exhaustively observed, the inference from a customary conjunction must always remain uncertain, no matter how high a probability it derives from the multiplication of like instances. To this first point, concerning the dependence of the probability of generalizations from experience upon the frequency of the observed instances, Hume adds a second point about the similarity of the cases under obser-

variation. Analogy, he says, "leads us to expect from any cause the same events, which we have observed to result from similar causes. Where the causes are entirely similar, the analogy is perfect, and the inference drawn from it is regarded as certain and conclusive. . . . But where the objects have not so exact a similarity, the analogy is less perfect, and the inference is less conclusive; though still it has some force, in proportion to the degree of similarity and resemblance." The absence of perfect similarity is Hume's second reason for the inconclusiveness or uncertainty of inductive generalizations.

The contrary supposition—that one case can be perfectly representative of an infinite number of similar cases—may explain why Aristotle seems to think that induction is able to produce the primary truths or principles of science with a certitude which gives certainty to all the demonstrations founded on these axioms. Another explanation of Aristotle's view may be found in his distinction between scientific and dialectical induction. He regards the former as based on the kind of common experience which, unlike even the best experiment, admits of no exceptions. In contrast, dialectical induction, or the still weaker form of induction which he calls "rhetorical," is based on an enumeration of cases (which may not be complete) or upon a single example (which provides no safeguard against possible exceptions).

In its dialectical form, the inductive argument proceeds from a number of particulars

taken for granted. Aristotle offers this example of dialectical induction: "Supposing the skilled pilot is the most effective, and likewise the skilled charioteer, then, in general, the skilled man is the best at his particular task." In its rhetorical form, no more than a single example may be used, as when the orator generalizes that honesty is the best policy from the story of a particular individual who was finally rewarded for his virtue.

In both forms, the inductive generalization is at best probable; and it is more or less probable according to the soundness of the suppositions or the examples from which it originates—to be tested only by extending the enumeration of particulars. But if an induction is merely probable in the first place, it can only be made more probable, it can never be made certain, by multiplying cases or by increasing their variety.

Aristotle's theory of dialectical induction thus seems to have a bearing on the probability of induction from limited experiments (or from a single experiment whose perfection is not assured) and of induction from the frequency or variety of observed instances. The other point to be noted is that Bacon's basic rule of gradual ascent from particular cases through less general to more general propositions seems to be relevant to dialectical induction, but not, on Aristotle's view, to that kind of induction which produces the axioms or principles of science.

OUTLINE OF TOPICS

	PAGE
1. The theory of induction: generalization from particulars	812
1a. Induction and intuition: their relation to reasoning or demonstration	
1b. Inductive reasoning: the issue concerning inductive and deductive proof	
2. The conditions or sources of induction: memory, experience, experiment	813
3. The products of induction: definitions, axioms, principles, laws	
4. The use of induction in argument	
4a. Dialectical induction: securing assumptions for disputation	
4b. Rhetorical induction: inference from example in the process of persuasion	814
5. The role of induction in the development of science: the methods of experimental and enumerative induction	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The theory of induction: generalization from particulars

Chapter 40: INFINITY

INTRODUCTION

ONE of the persistent questions concerning infinity is whether we can know or comprehend it. Another is whether the infinite exists, and if so, to what kind of thing infinity belongs. It is not surprising, therefore, that the discussion of infinity often borders on the unintelligible.

The idea of infinity, like the idea of eternity, lacks the support of the imagination or of sense-experience. The fact that the infinite cannot be perceived or imagined seems sufficient to lead Hobbes and Berkeley to deny its reality. "Whatsoever we imagine is *finite*," writes Hobbes. "Therefore there is no idea, or conception of anything we call *infinite*. . . . When we say anything is infinite, we signify only that we are not able to conceive the ends and bounds of the thing named, having no conception of the thing, but of our own inability."

On similar grounds Berkeley rejects the possibility of infinite division. "If I cannot perceive innumerable parts in any infinite extension," he writes, "it is certain that they are not contained in it: but it is evident, that I cannot distinguish innumerable parts in any particular line, surface, or solid, which I either perceive by sense, or figure to myself in my mind; wherefore I conclude that they are not contained in it."

But for most of the great writers on the subject, the impossibility of representing infinity and eternity to the imagination does not render them inconceivable or meaningless. Yet it does account for the difficulty of grasping their meaning, a difficulty further increased by the fact that, whatever their meaning, *infinity* and *eternity* are indefinable. To define the infinite would be to limit—even in thought—the unlimited.

The notion of infinity involves greater perplexities than that of eternity. The meaning of

eternity is weighted with the mystery of God, the world, and time. All these affect the conception of infinity; but for the infinite there are also the mysteries of number and of space, of matter and motion. In the sphere of quantity, or of things subject to quantity, infinity is itself the source of mystery, or at least the root of difficulty in analysis. It is the central term in the discussion of the continuous and the indivisible, the nature of series and of limits.

AS INDICATED in the chapter on ETERNITY, that idea in each of its applications seems to have one or the other of two meanings—(1) the meaning in which it signifies infinite time, time without beginning or end, and (2) the meaning in which it signifies the timelessness or immutability of being. Both meanings are negative, so far as our understanding is concerned. Yet what is signified by the second is in itself something positive, at least in the opinion of those who think that to be exempt from change entails having every perfection or being lacking in nothing.

This split in meaning also occurs in the idea of infinity. As applied to being, the term *infinite* signifies something positive, even though our understanding of what is signified remains negative or, at best, analogical. An infinite being is one which lacks no attribute that can belong to a being. This is the positive condition of absolute perfection. The infinite here still means the unlimited, but that which is unlimited in being has no defect. To lack deficiencies is to be perfect.

It is in this sense that Spinoza defines God as "Being absolutely infinite, that is to say, substance consisting of infinite attributes, each one of which expresses eternal and infinite essence." Like Spinoza, Aquinas maintains that "besides God nothing can be infinite." But he

distinguishes the absolute or positive sense in which God alone is infinite from the sense of the word in which it can be said that "things other than God can be relatively infinite, but not absolutely infinite." This other meaning, according to Aquinas, is not only relative but negative, for it connotes "something imperfect." It signifies indeterminacy or lack of perfection in being.

What Aquinas calls the relative or potential infinite, he attributes to matter and to quantities—to bodies, to the magnitudes of space and time, and to number. This sense of "infinite" corresponds to that meaning of "eternal," according to which time consists of an endless series of moments, each having a predecessor; each a successor, no matter how far one counts them back into the past or ahead into the future.

But in the field of quantities other than time, the meanings of infinite and eternal part company. There is, of course, some parallelism between infinite space and infinite time, insofar as an infinite extension is one which does not begin at any point or end at any; but the consideration of space and number leads to an aspect of infinity which has no parallel in the consideration of eternity.

"In sizes or numbers," Pascal writes, "nature has set before man two marvelous infinities. . . . For, from the fact that they can always be increased, it follows absolutely that they can always be decreased. . . . If we can multiply a number up to 100,000 times, say, we can also take a hundred thousandth part of it by dividing it by the same number we multiply it with, and thus every term of increase will become a term of division by changing the integer into a fraction. So that infinite increase includes necessarily infinite division." As endless addition produces the infinitely large, so endless division produces the infinitesimal or the infinitely small.

A trillion trillion is a finite number, because the addition of a single unit creates a larger number. The fact that the addition of another unit produces a different number indicates that a trillion trillion has a determinate size, which is the same as saying that it is a finite number. An infinite number cannot be increased by addition, for it is constituted—in thought at

least—as a number larger than the sum of any two finite numbers; which is another way of saying that it is approached by carrying on the process of addition endlessly. The size of an infinite number is therefore indeterminate.

What Galileo points out about two infinite quantities seems to hold for an infinite and a finite quantity. He asks us to consider the totality of all integers (which is infinite) and the totality of their squares (which is also infinite). On the one hand, there appear to be as many squares as there are integers; on the other hand, the totality of integers includes all the squares. Precisely because "the number of squares is not less than the totality of all numbers, nor the latter *greater than* the former," Galileo insists that "the attributes 'equal,' 'greater,' and 'less' are not applicable to infinite, but only to finite quantities." Nor does the sense in which one finite quantity can be greater or less than another—that is, by a determinate difference between them—apply in the comparison of a finite and an infinite quantity. The latter, being indeterminately large, is indeterminately larger than any finite quantity.

These remarks apply to the infinitely small as well. The infinitesimal is immeasurably small or indeterminately less than any finite fraction, no matter how small, because its own size is indeterminate. The finite fraction, itself a product of division, can be divided again, but if an infinitesimal quantity were capable of further division, it would permit a smaller, and since that smaller quantity would be a determinate fraction of itself, the infinitesimal would have to be determinate in size. Since that is not so, the infinitesimal must be conceived as the indivisible or as the limit approached by carrying on division endlessly.

"Because the hypothesis of indivisibles seems somewhat harsh," Newton proposes an analysis in terms of what he calls "nascent and evanescent quantities," or quantities just *beginning* to be more than nothing or just at the point at which they *vanish* into nothing. "As there is a limit which the velocity at the end of a motion may attain, but not exceed . . . there is a like limit in all quantities and proportions that begin or cease to be." Newton warns his

reader, therefore, that if he "should happen to mention quantities as least, or evanescent, or ultimate," the reader is "not to suppose that quantities of any determinate magnitude are meant, but such as are conceived to be always diminished without end."

Later, speaking of quantities which are "variable and indetermined, and increasing or decreasing, as it were, by a continual motion or flux," he adds: "Take care not to look upon finite quantities as such." The method of fluxions provides an infinitesimal calculus on the hypothesis of limits rather than of indivisibles.

THROUGH ALL THESE conceptions of infinity—metaphysical, mathematical, and physical—run the paired notions of the unlimited and of limits approached but not attained. The finite is neither unlimited nor does it insensibly approach a limit. There are also the opposite notions of the perfect and the indeterminate. The finite is neither, for it is determinate without being a totality or complete.

Though they have a common thread of meaning, and though each raises similar difficulties for the understanding, the conception of infinity in being or power, and the conception of infinite (or infinitesimal) quantity require separate consideration. The same questions may be asked of each, questions about the existence of the infinite and about our knowledge of it, but the same answers will not be given in each case. There are those who deny the existence of an actually infinite body or an actually infinite number, yet affirm the infinite existence of God. There are those who declare the infinity of matter to be intrinsically unintelligible, but maintain that God, Who is infinite, is intrinsically the most intelligible object. They add, of course, that the infinite being of God cannot be comprehended by our finite intellects.

On each of these points, an opposite view has been taken, but the dispute concerning the infinity of God involves issues other than those which occur in the controversy over the infinite divisibility of matter or the infinity of space and time. It seems advisable, therefore, to deal separately with the problems of infinity as they arise with respect to different objects or occur in different subject matters.

THE CONCEPTION of God, in the words of Anselm, as a being "than which a greater cannot be conceived"—or, in the words of Kant, as an *ens realissimum*, a most real being—expresses the plenitude of the divine nature and existence. The mediaeval thesis, defended by Descartes, that God's essence and existence are identical, implies that neither is contracted or determined by the other. The still earlier notion of Aristotle, repeated by Aquinas, that God is pure actuality, carries with it the attributes of completeness or perfection, which are the positive aspects of immutability or incapacity for change. Spinoza's definition of substance as that which exists, not only in itself, but through itself and by its very nature, entails the autonomy or utter independence of the divine being.

These are so many different ways of stating that God is an infinite being. Both Aquinas and Spinoza make infinity the basis for proving that there can be only one God. When Spinoza argues that "a plurality of substances possessing the same nature is absurd," he has in mind the identification of infinite substance with God. "If many gods existed," Aquinas writes, "they would necessarily differ from each other. Something would therefore belong to one, which did not belong to another. And if this were a privation, one of them would not be absolutely perfect; but if it were a perfection, one of them would be without it. So it is impossible for many gods to exist"—that is, of course, if infinity is a property of the divine nature. Aquinas makes this condition clear when he goes on to say that "the ancient philosophers, constrained as it were by the truth, when they asserted an infinite principle, asserted likewise that there was only one such principle."

But while it is impossible for there to be two infinities of being, it is not impossible for there to be two, or more, infinite quantities. One explanation of this difference seems to be the actuality or existence of an infinite being, in contrast to the conceptual character of the infinite objects of mathematics, which are sometimes called "potential infinities" because they are conceived as in an endless process of becoming, or as approaching a limit that is never reached.

When the physical existence of infinite quan-

tities is asserted, as, for example, a universe of infinite extent or an infinite number of atoms, the uniqueness of these actual totalities seems to follow. Two infinite worlds cannot co-exist, though the one world can be infinite in several distinct respects—in space or duration, or in the number of its constituents—even as the infinity of God, according to Spinoza, involves “infinite attributes, each one of which expresses eternal and infinite essence.”

Spinoza’s argument against two actual infinities seems to find confirmation in the position taken by Aquinas that God’s omnipotence does not include the power to create an infinite world. God’s infinity, as we have already noted, follows from the identity of God’s essence and existence. Since a created being has existence added to its essence, Aquinas asserts that “it is against the nature of a created thing to be absolutely infinite. Therefore,” he continues, “as God, although He has infinite power, cannot make a thing to be not made (for this would imply that two contradictories are true at the same time), so likewise He cannot make anything to be absolutely infinite.”

On this view, an infinite world cannot co-exist with an infinite God, if, in their separate existence, one is dependent on the other, as creature upon creator. The infinity of the world or of nature, in Spinoza’s conception, is not separate from the infinity of God, but consists in the infinity of two of God’s attributes—extension and thought.

In our time there has arisen the conception of a finite God—a God who, while the most perfect being, yet is not without capacity for growth or change, a God who is eternal without being immutable. This conception, which in the light of traditional theology appears to be as self-contradictory as *round square*, has arisen in response to the difficulties certain critics have found in the traditional doctrine of an infinite being. They point to the difficulty of understanding how finite beings can exist separate from, yet in addition to, an infinite being; they also cite difficulties in the notions of infinite knowledge, infinite power, and infinite goodness.

The infinity of the divine omniscience extends to the possible as well as to the actual. But the possible includes things which are in-

compatible with one another, things which, in the language of Leibnitz, are not *compossible*. The *impossible* would thus seem to be embraced in the infinite scope of divine thought or knowledge. In the view of one theologian, Nicolas of Cusa, the mystery of God’s infinity is best expressed by affirming that in God all contradictions are somehow reconciled.

The infinity of God’s power, or the divine omnipotence, also raises questions about the possible and the impossible. Is nothing impossible to God or must it be said that there are certain things which not even God can do, such as reverse the order of time or create a world which shall be as infinite and perfect as himself? In the assertion that God cannot do the impossible, Aquinas sees no limitation on God’s power. The impossible, he writes, does not “come under the divine omnipotence, not because of any defect in the power of God, but because it has not the nature of a feasible or possible thing.” For this reason, he claims, “it is better to say that such things cannot be done, than that God cannot do them.” The inability to do the *undoable* constitutes no violation of infinite power, even as the lack of nothing does not deprive infinite being of anything.

The infinite goodness of God is sometimes set against the fact of evil, or the existence of imperfections, in the created world. This aspect of the problem of evil, like that which concerns man’s freedom to obey or disobey the divine will, cannot be separated from the fundamental mystery of God’s infinity—in power and knowledge as well as in goodness. The problem is considered in the chapter on GOOD AND EVIL. The point there mentioned, that evil is essentially non-being or deprivation of being, leads to one solution of the problem. It accepts the finitude, and consequently the imperfection, of creatures as a necessary consequence of God’s infinity. The best of all possible worlds cannot be infinitely good.

TO MAN ALONE, among all admittedly finite things, has infinity been attributed and even made a distinctive mark of his nature. Does this introduce a new meaning of infinity, neither quantitative nor divine?

It has seldom if ever been questioned that man is finite in being and power. The limits of

human capacity for knowledge or achievement are a perennial theme in man's study of man. Yet it is precisely with regard to *capacity* that certain writers have intimated man's infinity.

Pascal, for example, finds the apparent contradictions in human nature intelligible only when man is understood as yearning for or impelled toward the infinite. "We burn with desire," he says, "to find solid ground and an ultimate sure foundation whereon to build a tower reaching to the Infinite. But our whole groundwork cracks and the earth opens to abysses." In this fact lies both the grandeur and the misery of man. He aspires to the infinite, yet he is a finite being dissatisfied with his own finitude and frustrated by it.

It is sometimes said that the touch of infinity in man—with the suggestion that it is a touch of madness—consists in his wanting to be God. Those who regard such desire as abnormal or perverse interpret it as a misdirection of man's natural desire to know God face to face and to be filled with the love of God in the divine presence. But, according to the theory of natural desire, the tendency of each nature is somehow proportionate to its capacity. If man's restless search for knowledge and happiness can be quieted only by the possession of the infinite truth and goodness which is God, then man's intellect and will must somehow be as infinite in nature as they are in tendency. Yet that is not an unqualified infinity, for the same theologians who teach that man naturally seeks God also hold that man's finite intellect cannot *comprehend* the infinite being of God as God knows Himself. Nor do they think that man's capacity for knowing and loving God can be fulfilled except in the beatific vision, which is a supernatural gift rather than a natural achievement.

These and related matters are discussed in the chapters on *DESIRE* and *KNOWLEDGE*. The great books speak of other objects than God as objects of man's infinite desire. The appetite for money, for pleasure, or for power seems to be an infinite craving which no finite quantity of these goods ever satisfies. Two comments are made upon this fact, which is so amply evidenced in the human record. One is that man's infinite lust for worldly goods expresses even as it conceals his natural desire for a truly infinite good. The other is that these worldly goods are

seductive objects precisely because they are infinite.

Here the word "infinite" is used, not in the sense which signifies perfection, but in the quantitative sense which has the meaning of indetermination. Plato's division, in the *Philebus*, of goods into the finite and the infinite separates measured and definite goods from those which need some limitation in quantity. Socrates exemplifies the distinction by reference to the fact that "into the hotter and the colder there enters a more and a less" and since "there is never any end of them . . . they must also be infinite." In contrast, "when definite quantity is once admitted, there can be no longer a 'hotter' or a 'colder.'" Such things, he says, "which do not admit of more or less" belong "in the class of the limited or finite."

Following the line of this example, Socrates later distinguishes between infinite and finite pleasures, or pleasures without limit and those which have some intrinsic measure. "Pleasures which are in excess," he says, "have no measure, but those which are not in excess have measure; the great, the excessive . . . we shall be right in referring to the class of the infinite, and of the more and less," and "the others we shall refer to the class which has measure." The fact that the goodness of wealth or of certain pleasures is indeterminate or indefinite makes it necessary to determine or measure the amount of wealth it is good to possess, or the quantity of such pleasure it is good to enjoy.

As in the case of desire, so the human intellect is also said to be infinite in the sense of reaching to an indefinite quantity. On the theory which he holds that the intellect knows by means of universal concepts, Aquinas attributes to the human mind "an infinite power; for it apprehends the universal, which can extend itself to an infinitude of singular things." Each universal signifies what is common to an indefinitely large class of particular instances.

There is still another sense in which the intellect is said to be infinite, namely, by reason of its having the potentiality to apprehend *all* knowable things. But this is a relative infinity, as is the corresponding infinity of prime matter, which is conceived as the potentiality for taking on all forms. In both cases, the infinite is qualified by a restriction—on the kind of things

knowable to the intellect and the type of forms receivable in matter. The infinity of prime matter—matter totally devoid of form—is also comparable to the infinity of God in a contrast of extreme opposites: the absolute indeterminacy of pure potentiality on the one hand, the absolute perfection of pure actuality on the other.

THE INFINITY OF matter involves different considerations when the problem concerns, not prime matter, but material things—bodies. The question is twofold. Can there be a body of infinite magnitude? Is there an infinite number of bodies? To both questions Aristotle gives the negative answer, while Spinoza seems to answer the first, and Lucretius the second, affirmatively.

Spinoza's affirmation may be qualified, of course, by his conception of infinite body as an attribute of God. But there is no qualification on Lucretius' assertion that "the first-beginnings of things are infinite," unless it is his statement that "the first-beginnings of things have different shapes, but the number of shapes is finite." It is only the number of atoms which is infinite, not their variety.

Aristotle presents many arguments against the existence of an infinite body or an infinite number of things, all of which ultimately rest on his distinction between an actual and a potential infinite. It is not that infinity in magnitude or multitude is impossible—for he affirms the infinity of time and he insists upon the infinite divisibility of matter—but rather that if an infinite body existed its infinity would have to be actual. Its actuality would necessarily involve certain determinations, especially those of dimension and place, which would be inconsistent with the indeterminacy of the infinite. Similarly, a multitude of co-existing things—unlike the moments of time which do not co-exist—cannot be infinite, because their co-existence implies that they can be actually numbered, whereas their infinity implies that they are numberless.

The potential infinite, Aristotle writes, "exhibits itself in different ways—in time, in the generations of man, and in the division of magnitudes. For generally," he says, "the infinite has this mode of existence: one thing is always

being taken after another, and each thing that is taken is always finite, but always different." When this takes place in the division of spatial magnitudes, "what is taken persists, while in the succession of times and of men, it takes place by the passing away of these in such a way that the source of supply never gives out."

The opposition between Lucretius and Aristotle with regard to the divisibility of matter is discussed in the chapter on ELEMENT. The notions of infinity and continuity are differently employed on the two sides of the argument. Where Aristotle makes the continuity of matter the condition of its infinite divisibility, Lucretius makes the atom's continuity—its solidity or lack of void—the cause of its indivisibility. Where Aristotle asserts that at any moment there can be only a finite number of particles in the world because the partition of matter cannot be infinitely carried out short of infinite time, Lucretius, on the contrary, thinks that the division of matter into smaller and smaller parts finds an end in the atomic particles; and yet he also asserts an infinite number of atoms.

To contain an infinite number of atoms, an infinite space is required, according to Lucretius. This presents no greater difficulty for him than an infinite time. Aristotle, on the other hand, differentiates between space and time with respect to infinity. Time can be potentially infinite by way of addition because "each part that is taken passes in succession out of existence." But though space may be infinitely divisible, it cannot be infinitely extended, for all its parts, unlike those of time, must co-exist. It would therefore have to be an *actually*, rather than a *potentially*, infinite quantity, and this Aristotle thinks is impossible.

These and other conflicting views concerning the infinity of space and time appear in Kant's statement of the first cosmological antinomy. His intention is not to resolve the issues, but to show that they cannot be resolved by proof or argument. To do this, Kant sets up what seems to him to be equally strong—or equally inconclusive—arguments for and against the infinity of space and time.

Suppose it be granted, Kant argues on the one hand, that "the world has no beginning in time." Then it would follow that "up to every given moment in time, an eternity must have

elapsed, and therewith passed away an infinite series of successive conditions or states of things in the world." But since "the infinity of a series consists in the fact that it can never be completed by means of a successive synthesis," it also "follows that an infinite series already elapsed is impossible, and that consequently a beginning of the world is a necessary condition of its existence."

On the other hand, Kant argues with what he thinks is equal force, "let it be granted that [the world] has a beginning. A beginning," he explains, "is an existence which is preceded by a time in which the thing does not exist." Then, Kant continues, "on the above supposition, it follows that there must have been a time in which the world did not exist, that is, a void time. But in a void time, the origination of a thing is impossible; because no part of any such time contains a distinctive condition of being in preference to that of non-being. . . . Consequently, many series of things may have a beginning in the world, but the world itself cannot have a beginning, and is, therefore, in relation to past time, infinite."

With regard to the infinity or finitude of space, Kant proceeds similarly. If we suppose space to be infinite, then "the world must be an infinite given total of co-existent things." But in order to "cogitate the world, which fills all spaces, as a whole, the successive synthesis of the parts of an infinite world must be looked upon as completed; that is to say, an infinite time must be regarded as having elapsed in the enumeration of all co-existing things." This, Kant argues, "is impossible," and therefore "an infinite aggregate of actual things cannot be considered as a given whole." Hence it follows that "the world is, as regards extension in space, *not infinite*, but enclosed in limits."

If, however, we suppose "that the world is finite and limited in space, it follows," according to Kant, "that it must exist in a void space, which is not limited. We should, therefore, meet not only with a relation of things *in space*, but also a relation of things *to space*." But the "relation of the world to a void space is merely a relation to *no object*" and "such a relation, and consequently the limitation of the world by void space, is nothing." It follows, therefore, Kant concludes, that "the world, as regards

space, is not limited; that is, it is infinite in regard to extension."

The way in which these opposite arguments nullify each other reveals more than our inability to prove or disprove the infinity of space and time. It shows, in Kant's theory of human knowledge, that we are "not entitled to make any assertion at all respecting the whole object of experience—the world of sense."

ONE OTHER PROBLEM of infinity in the sphere of physics receives its initial formulation in one of the great books—in the part of the *Dialogues Concerning the Two New Sciences* where Galileo discusses the uniform acceleration of a freely falling body. The body which is said to accumulate equal increments of velocity in equal intervals of time is also said to start "from infinite slowness, *i.e.*, from rest." One of the persons in the dialogue challenges this, saying that "as the instant of starting is more and more nearly approached, the body moves so slowly that, if it kept on moving at this rate, it would not traverse a mile in an hour, or in a day, or in a year, or in a thousand years; indeed, it would not traverse a span in an even greater time; a phenomenon which baffles the imagination, while our senses show us that a heavy falling body suddenly acquires great speed."

What our senses *seem* to show us is corrected by an experiment which refines the observation. But this still leaves a purely analytical question. Against the statement that the "velocity can be increased or diminished without limit," Simplicio points out in the dialogue that "if the number of degrees of greater and greater slowness is limitless, they will never be all exhausted," and therefore the body will never come to rest when it is slowing down or be able to start to move when it is at rest.

"This would happen," Salviati answers, "if the moving body were to maintain its speed for any length of time at each degree of velocity, but it merely passes each point without delaying more than an instant, and since each time interval, however small, may be divided into an infinite number of instants, these will always be sufficient to correspond to the infinite degrees of diminished velocity."

The problem of the infinitesimal velocity provides another illustration of the difference

between infinity in the physical and the mathematical orders. Unlike parallel lines in Euclidean geometry, which are lines that remain equidistant from one another when both are prolonged to infinity, an asymptote is a straight line which a curved line continuously approaches but never meets, even when both are infinitely extended. The distance between the curve and its asymptote diminishes to smaller and smaller intervals, but no matter how small they become, the two lines never coincide. The diminishing intervals between the curve and its asymptote are like the diminishing degrees of velocity in a body starting from or coming to rest. But we know that the body does begin or cease to move, and so there is the mysterious jumping of the gap between rest and motion in the physical order, whereas in the mathematical order the limiting point can be forever approached and never reached.

THERE IS ONE other context in which infinity is discussed in the great books.

The logicians treat certain terms and judgments as infinite. Aristotle, for example, regards the negative term—such as *not-man* or *not-white*—as indefinite. The indefiniteness of its signification may be seen when such terms are used as subjects of discourse. What is being talked about? The answer must be given, in part at least, in positive terms: *not-man* represents the *whole universe* leaving man out, or the *totality of everything* except man. Thus, in its positive signification, the negative term has a kind of infinity—the infinite totality of subjects diminished by one, the one that is negated.

In his classification of judgments, Kant makes a threefold division of judgments according to quality: the affirmative, the negative, and the infinite. The infinite judgment involves a negative in its construction, but when that negative is given an affirmative interpretation, the infinite significance of the proposition becomes apparent. An example will make this clear.

The proposition *this animal is-not white* is negative; it simply denies a certain quality of a certain thing. But the proposition *this animal is not-white* is infinite, for it affirms the negated term, and so places the subject in the infinite class or totality which includes everything

except white things. (The position of the hyphen serves to indicate whether the statement shall be construed negatively or affirmatively and infinitely.)

The problems of definition and demonstration are differently solved by logicians according to the way in which they propose to avoid infinite regressions in analysis or reasoning. There would be no end to the process of defining if every term had to be defined before it could be used in the definition of another term. There would be no beginning to the process of proof if, before a proposition could be used as a premise to demonstrate some conclusion, it had itself to be demonstrated as a conclusion from prior premises.

In his essay *On Geometrical Demonstration*, Pascal refers to the proposal of a plan for defining and proving everything. "Certainly this method would be beautiful," he says, "but it is absolutely impossible; for it is evident that the first terms we wished to define would presuppose others for their explication, and that similarly the first propositions we wished to prove would suppose others that preceded them, and it is thus clear we should never arrive at the first propositions."

The chapter on DEFINITION considers the character and choice of the indefinable terms by which an infinite regression is avoided in the elucidation of meanings. The chapters on INDUCTION and PRINCIPLE consider the various sorts of primary propositions—axioms, postulates, assumptions—by which a similar regression is avoided in the process of proof. The chapter on CAUSE deals with the problem of an infinite regression in causes and effects. Here it is appropriate to consider the difference between an infinite series of reasons and an infinite series of causes.

To the extent that both are truly series—the succession of one thing after another—neither seems to be impossible, *given infinite time*. Those who deny the possibility of an infinite number of causes distinguish between essential and accidental causes, that is, between causes which must co-exist with their effects and causes which can precede their effects, and cease to be before their effects occur. If there were an infinite time, there could be an infinite series of accidental causes. But it may be questioned whether,

even granted an infinite time, the relation between the premises and conclusion of reasoning permits an infinite regression. If the truth of a

conclusion cannot be known until the truth of its premises is known, then the pursuit of truth may be vitiated by a search *ad infinitum*.

	PAGE
1. The general theory of infinity	825
1a. The definite and indefinite: the measured and the indeterminate	
1b. The infinite in being and quantity: the actual and potential infinite; the formal and the material infinite	826
2. Infinity in the logical order	
2a. The infinity of negative and indefinite terms	
2b. The distinction between negative and infinite judgments	
2c. Infinite regression in analysis and reasoning	
3. The infinite in quantity	827
3a. Number: the infinite of division and addition	
3b. The infinite divisibility of continuous quantities: the infinitesimal; the method of exhaustion and the theory of limits	
3c. The infinity of asymptotes and parallels	
3d. The infinite extent of space	828
3e. The infinite duration of time and motion	
4. The infinity of matter	
4a. The infinite quantity or extent of matter: the problem of an actually infinite body	
4b. The infinite divisibility of matter: the issue concerning atoms	829
4c. The infinite potentiality of matter: the conception of prime or formless matter	
5. Infinity in the world	
5a. The infinite number of things and the infinite number of kinds	
5b. The number of causes	
6. The finite and the infinite in the nature of man	830
6a. The infinity of desire and will: the limits of human capacity	
6b. The infinity of the intellect: man's knowledge of the infinite	
7. The infinity of God	831
7a. The infinite being or essence of God	
7b. The infinite power of God	832
7c. God's infinite goodness and love	
7d. God's infinite knowledge	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 41: JUDGMENT

INTRODUCTION

THE word "judgment" has a range of meanings which includes three principal variants referring to (1) *a quality of the mind*, (2) *a faculty of the mind*, and (3) *an act of the mind*. Of these three meanings, it is the third which is extensively considered in this chapter; and it is this meaning of "judgment" which many writers use the word "proposition" to express. They sometimes substitute the one word entirely for the other; sometimes they use both words, not as strict synonyms, but to express distinct yet closely related aspects of the same fundamental phenomenon.

The sense in which judgment is a *quality of the mind* is the sense in which we ordinarily speak of a person as having sound judgment or poor judgment. "We credit the same people," Aristotle says, "with possessing judgment and having reached years of reason and with having practical wisdom and understanding." To be "a man of understanding and of good or sympathetic judgment," he continues, is to be "able to judge about the things with which practical wisdom is concerned."

The capacity to judge well concerning what is to be done is often connected with the capacity to deliberate about the advantages and disadvantages or other circumstances relevant to the action in question. It may or may not be accompanied by a capacity to resolve thought into action, to carry into execution the decision which judgment has formed. These three qualities of mind—deliberateness, judgment, and decisiveness—are conceived by Aristotle and Aquinas as belonging together as parts of the intellectual virtue they call "prudence" or "practical wisdom." The qualities may occur separately, but the prudent man will possess all three.

This meaning of "judgment" is reserved for discussion in the chapter on PRUDENCE; and in the chapter on LAW will be found the consider-

ation of the judgment which a court renders—the judgment which is the decision of a judge when he applies the law to the particular case. In the legal sense of a judicial decision, judgment reflects not so much the quality of the judge's mind as his duty and authority to dispose of the case and to have his decision executed by the appropriate officers of the law. The legal significance of judgment is not primarily psychological or logical; and, just as the moral consideration of judgment falls under prudence, the legal consideration is also more appropriately developed in the context of other ideas.

We are left with the meanings which belong to psychology, logic, and the theory of knowledge. The sense in which "judgment" designates a *faculty or function of the mind*—a distinct sphere of mental operation—is much more special than the sense in which "judgment" or "proposition" signifies a *particular act of the mind* in the process of knowing or in the verbal expression of that process. Many authors discuss the kinds of judgment which the mind makes, and the kinds of propositions it forms and asserts or denies, but only a few—notably Locke and Kant—use the word "judgment" to name a mental faculty.

Locke, for example, says that "the mind has two faculties conversant about truth and falsehood." One is the faculty of knowing; the other of judging. "The faculty which God has given man to supply the want of clear and certain knowledge, in cases where that cannot be had, is *judgment*: whereby the mind takes its ideas to agree and disagree, or, which is the same, any proposition to be true or false, without perceiving a demonstrative evidence in the proofs." The way in which Locke distinguishes between knowing and judging and the fact that he relates this distinction to the difference be-

tween certainty and probability suggest the parallel distinction between knowledge and opinion. The faculty of judgment for Locke is the equivalent of what other writers treat as the forming of opinions.

Kant also makes judgment a faculty. Along with understanding and reason, judgment is one of the three faculties of cognition. It has a distinct function of its own and is coordinate with the other two. As the laws of nature are the work of the understanding in the sphere of speculative reason; as the rules of the moral law are the work of the reason in the practical sphere, wherein it is related to the faculty of desire; so the purposiveness of nature comes under the faculty of judgment which operates in relation to the faculty of pleasure and pain.

Kant divides all the faculties of the soul into "three which cannot be any further derived from one common ground: the *faculty of knowledge*, the *feeling of pleasure and pain* and the *faculty of desire*." He sees each of the three cognitive functions (of understanding, judgment, and reason) as standing in a peculiar relation to these three primary faculties. The faculty of judgment functions with respect to pleasure and pain, which is connected with the faculty of desire. Yet the aesthetic judgment of beauty and the theological judgment of purposiveness in nature are of a speculative rather than a practical character. Because of these two related facts, Kant holds that "the judgement in the order of our cognitive faculties, forms a mediating link between Understanding and Reason."

Kant, perhaps more than any other thinker, makes judgment—both as a faculty and as an act—one of the central terms in his philosophy. It is pivotal in each of the three critiques, but it is the *Critique of Judgement* which serves to connect the *Critique of Pure Reason* and the *Critique of Practical Reason*. "The Understanding legislates *a priori* for nature as an object of sense—for theoretical knowledge of it in a possible experience. Reason legislates *a priori* for freedom and its peculiar causality; as the supersensible in the subject, for an unconditioned practical knowledge. The realm of the natural concept under one legislation, and that of the concept of freedom under the other, are entirely removed from all mutual influence which

they might have upon one another (each according to its fundamental laws) by the great gulf that separates the supersensible from phenomena." It is the judgment, according to Kant, which "furnishes the mediating concept between the concept of nature and that of freedom."

KANT'S THEORY of the faculties of understanding, judgment, and reason is so complex a doctrine that it cannot be readily compared with other analyses of the capacities or functions of mind. His threefold division bears a superficial—perhaps only a verbal—resemblance to Aquinas' division of mental acts into conception, judgment, and reasoning.

According to Aquinas, judgment is the second of the three acts of a single cognitive faculty variously called "mind" or "intellect" or "reason." This faculty, he writes, "first apprehends something about a thing, such as its essence, and this is its first and proper object; and then it understands the properties, accidents, and various dispositions affecting the essence. Thus it necessarily relates one thing with another by composition or division; and from one composition and division it necessarily proceeds to another, and this is *reasoning*."

The first act of the mind is conception, *i.e.*, the simple apprehension of the essence and properties of a thing. Judgment, the second act, unites or separates concepts by affirming or denying one of another. As in the Kantian analysis, judgment is a kind of mediating link; for after the judgment is formed by what Aquinas calls the "composition or division" of concepts, it in turn serves as the unit of the mind's third act, which is reasoning. Reasoning is the process of going from judgment to judgment.

The act of judgment is that act of the mind, and the only act, which can have the quality of truth or falsity. "Truth," Aquinas writes, "resides in the intellect composing and dividing"; for when the intellect "judges that a thing corresponds to the form which it apprehends about that thing, then it first knows and expresses truth. . . . In every proposition," the mind "either applies to, or removes from, the thing signified by the subject some form signified by the predicate." Moreover, the judgment involves assertion or denial as the

concept does not. Whatever truth there is implicitly in concepts must be explicated in judgments and the truth of the conclusion in reasoning depends upon the truth of the judgments which are the premises. The judgment, therefore, is the basic unit of knowledge.

On this last point Kant seems to be in agreement with earlier writers. It is possible, therefore, to compare Kant's classification of judgments or propositions with the classifications of Aristotle, Descartes, or Locke. But it is necessary, first, to consider the relation between judgment and proposition. After that we can examine the difference between theoretic and practical judgments. With respect to the theoretic judgment (or proposition), we shall be able to state opposite views of the nature of the judgment and diverse views of the formal structure of judgments, their material content, their relation to one another and to the whole process of knowing.

THE SENTENCE "all men are mortal" can be interpreted as expressing a judgment or a proposition. From certain points of view, the choice of interpretation makes no difference; for example, it does not matter whether, in a consideration of "all men are mortal" and "some men are not mortal," the comparison is expressed in terms of universal and particular, affirmative and negative, judgments *or* propositions, or whether it is said that these are contradictory judgments *or* contradictory propositions. The basic problems of logic seem to be conceived in the same way by writers like Aristotle and Locke, who tend to use "proposition" in place of "judgment," and by writers like Aquinas, Descartes, and Kant, who tend to use both words with some difference in meaning.

What is the difference? It is sometimes understood as a difference between an act of the mind, asserting or denying, and the subject matter being asserted or denied. The proposition is that which may be either asserted or denied; or in the third alternative stressed by Descartes, the mind may suspend judgment and merely entertain the proposition. It may decline to judge it true or false, and so refuse to assert or deny it. The fact that the proposition is itself either affirmative or negative does not signify its assertion or denial by a judgment of the

mind, for an affirmative proposition can be denied and a negative can be affirmed.

Judgment adds to the proposition in question the mind's decision with respect to its truth or falsity. That decision may be right or wrong. A proposition which is in fact true may be denied. The truth of the proposition is unaffected by the falsity of the judgment, or if the mind suspends judgment on a proposition which is true, the truth of the proposition has failed to elicit a judgment. This seems to confirm the separation between the proposition and the judgment.

Sometimes the difference between the judgment and the proposition is found in the difference between the mind's act of "composing" or "dividing" concepts and the formulation of that act in words. On this view, the proposition is related to the judgment as the term to the concept, as the physical to the mental word, as language to thought. In consequence, there is no separation for either the judgment or the proposition between that which can be asserted or denied and the assertion or denial of it. The affirmative judgment *is* an assertion, the negative a denial; and the same holds for the affirmative and the negative proposition.

But on either theory of the difference, it is thought necessary to distinguish between the sentence and the proposition, especially when the proposition is also regarded as a verbal formulation—a statement of thought in words. This is particularly important in a logical treatise like Aristotle's, which analyzes *terms*, *propositions*, and *sylogisms* rather than *concepts*, *judgments*, and *reasonings*.

In both the *Categories*, which deals with terms, and the treatise *On Interpretation*, which deals with propositions, Aristotle differentiates between a grammatical and a logical handling of the units of language. His distinction, for example, between simple and composite expressions (words and phrases on the one hand, and sentences on the other) is related to, but it is not identical with, his distinction between terms and propositions. Not every simple expression can be used as a term. For example, prepositions and conjunctions cannot be used as terms, as nouns and verbs can be. Nor can every sentence be used as a proposition.

"A sentence is a significant portion of speech,"

Aristotle writes, "some parts of which have an independent meaning, that is to say, as an utterance, though not as the expression of any positive judgment. . . . Every sentence has meaning," he goes on, "by convention. Yet every sentence is not a proposition; only such are propositions as have in them truth or falsity. Thus a prayer is a sentence, but is neither true nor false. Let us therefore dismiss all other types of sentence but the proposition, for this last concerns our present inquiry, whereas the investigation of the others belongs rather to the study of rhetoric or of poetry."

It seems possible to relate the two separate distinctions we have been considering—that between sentence and proposition and that between proposition and judgment. As the proposition can be regarded as a sentence logically (rather than grammatically) construed, so it can also be regarded as the linguistic expression of a judgment of the mind. The proposition thus appears to be a kind of middle ground between language and thought, for when a sentence is used for the purpose of stating a proposition it can also express a judgment. When a judgment is expressed in words, the verbal statement is also a proposition. The proposition is thus the logical aspect of a sentence and the verbal aspect of a judgment. A similar consideration of terms in relation to words and concepts occurs in the chapter on *IDEA*.

WHAT IS PERHAPS the most fundamental division in the sphere of judgments—the separation of the practical from the theoretic or speculative—can be initially explained by reference to the forms of language. Aristotle's remark about sentences and propositions tends to identify propositions with declarative sentences. Sentences in the subjunctive mood state prayers or wishes, not propositions. An interrogative sentence asks a question to which the answers may be propositions, or they may be hopes and desires. The imperative sentence issues a command to act in a certain way, whether the command is a direction for others or a decision for one's self. This last type of sentence represents the practical mood of thought as well as speech—thought concerned with actions to be done or not done, rather than with what does or does not exist.

The imperative sentence is not the only kind of practical statement. It is merely the most terse and emphatic. It is also the expression of that type of practical judgment which most immediately precedes action itself, or the execution of a command. There are other sentences which, because they are apparently declarative in form, conceal their imperative mood. Yet upon examination their essentially practical rather than theoretic significance can be discovered.

Sentences which contain the words "ought" or "should" are of this sort, *e.g.*, "Men ought to seek the truth," "You should work for peace," "I ought to make this clear." By omitting "should" or "ought," these sentences can be changed into the strictly declarative mood of theoretic propositions, *e.g.*, "Men do seek the truth," "You will work for peace," "I shall make this clear." They can also be made plainly imperative, *e.g.*, "Seek the truth," etc. The chief difference between the blunt form of the imperative and its indicative expression using "ought" or "should" is that the latter indicates the person to whom the command is addressed.

The contrast in significance between a declarative and an imperative statement does, therefore, convey the distinction between a theoretic and a practical proposition or judgment. Kant's further division of practical judgments into the hypothetical and the categorical simply differentiates commands or "oughts" which involve no preamble from those which propose that action be taken to achieve a certain end, or which base a direction to employ this or that means on the supposition that a certain end is desired or sought. Examples of hypothetical or conditional imperatives would be such judgments as "If you want to be happy, seek the truth" or "Seek the truth in order to be happy."

The distinction between theoretic and practical judgments is currently made in terms of the contrast between statements of fact and statements of value or, as in judicial procedure, between statements of fact and rules of law. A rule of law has the form of a general practical statement, usually a conditional rather than a categorical imperative; whereas the decision of a court applying the rule to a case is a particular practical judgment.

Beginning with Francis Bacon, the distinction between the theoretic and the practical is also made in terms of the difference between the pure sciences and their applications in technology. Technical judgments, prescribing the way to make something or produce a certain effect, are traditionally associated, under the head of the practical, with moral judgments concerning the good to be sought and the ways of seeking it. Both are prescriptive of conduct rather than descriptive of existence or nature in the manner of theoretical statements.

Thinkers like Aristotle, Aquinas, and Kant, who divide science or philosophy into the theoretical disciplines (e.g., physics, mathematics, metaphysics) and the practical or moral disciplines (e.g., ethics, economics, politics), place the discussion of the difference between theoretical and practical judgments in the context of other distinctions; as, for example, between the speculative and the practical reason, or between theoretic and practical knowledge; or in the context of considering the kinds of truth appropriate to each, and the modes of inference or demonstration in each. These related distinctions and considerations are treated in the chapters on KNOWLEDGE, MIND, REASONING, and TRUTH.

For the most part, however, the great books in the tradition of logic itself do not give an analysis of practical judgments or reasoning in any way comparable to their treatment of the theoretic forms of thought and statement. The logical problems concerning propositions or judgments, now to be considered, apply only to the theoretic forms.

TWO BASIC ISSUES in the theory of propositions or judgments have their origin in the tradition of the great books, but for their explicit and full development other works must be consulted—the special treatises on logic, of relatively recent date, listed in the Additional Readings. One of these two issues has already been briefly commented on, but for the full implications of the distinction between propositions and judgments one must go to such writers as Hegel, Bradley, Bosanquet, Cook Wilson, W. E. Johnson, and John Dewey, who make this distinction the crux of a controversy over the scope of formal logic.

The other basic issue lies in the opposition between what has come to be called “subject-predicate logic” and “relational logic.” Here one side is fully represented by the *Organon* of Aristotle and by the later books which adopt the Aristotelian logic of predication. The other logical theory is intimated but not fully developed by such writers as Locke, Hume, Kant, and William James who, though they sometimes employ the subject-predicate formulation, tend to construct the unit of knowledge—the proposition or judgment—as a relation between ideas or concepts.

The fact that Kant places substance and accident under the category of relation can be taken as exemplifying this tendency, as can Locke’s emphasis on the connection of, and agreement or disagreement between, our ideas. Nevertheless, these are at most intimations of the theory that the proposition is a relation of two or more terms, not the application of a predicate to a subject. As indicated in the chapter on LOGIC, the relational theory does not receive an adequate exposition until the modern development of symbolic or mathematical logic, beginning with the writings of Boole, Jevons, and Venn, and culminating in such works as the *Principia Mathematica* of Russell and Whitehead.

In the Aristotelian logic, simple propositions consist of a subject and a predicate—what is being talked about and what is said of it. The copula “is” is the sign of predication; it also signifies an affirmation of the unity of subject and predicate. For example, in “Socrates is a man” the predicate *man* is applied to the subject *Socrates*, and the unity of *being Socrates* and *being a man* is affirmed. All the terms of discourse can be classified according to their character as subjects and predicates; so, too, can propositions be classified by reference to the type of subject-term and the type of predicate-term which comprise them. The formal structure not only of the proposition, but also of the syllogism, is determined by the order of subjects and predicates. “When one term is predicated of another,” Aristotle writes, “any term which is predicable of the predicate will also be predicable of its subject.”

According to the theory of the proposition as a relation of terms or of classes, predication

represents merely one type of relationship—the membership of an individual in a class, or the inclusion of one class in another. There are many other types of relation which, it is held, cannot be reduced to class-membership or class-inclusion; as, for example, the relationship stated by the proposition “John hit James.” or the proposition “January comes before February.” Propositions can be classified according to the number of terms involved in a single relationship, or by reference to the type of relation which organizes them, whether it is symmetrical or asymmetrical, transitive or intransitive, reflexive or irreflexive. In this theory it is the character of the relationship, not the character of the terms, which is the fundamental element in logical analysis, and this determines the formal structure of inference as well as of propositions.

It has been claimed for each of these logical theories that it is the more general analysis and that it is able to reduce the formulations of the opposite theory to its own terms or subsume them as a special case. Certainly it is verbally possible to convert all predications into statements of relationship, or all relational statements into subject-predicate propositions. But this by itself does not seem to resolve the issue to the satisfaction of either theory; each side contends that such reductions violate its fundamental principles. Stated in its most drastic form, the unresolved question is whether there is one logic or two—or perhaps more.

WITHIN THE tradition of Aristotelian logic, there are divergent schemes for classifying propositions or judgments. So far as the great books are concerned, this can be best illustrated by mentioning Kant's departures in analysis.

Aristotle distinguishes between simple and composite propositions, the former consisting of a single subject and predicate, the latter “compounded of several propositions.” For example, since the two predicates in the proposition “This man is good and a shoemaker” do not form a unity, the sentence expresses a conjunction of two simple propositions: “This man is good” and “This man is a shoemaker.” Other types of compound propositions are the hypothetical and the disjunctive, *e.g.*, “If Socrates is a man, Socrates is mortal,” and “Either all men

are mortal or no men are mortal.” Kant treats these distinctions under the head of *relation*. He calls the proposition which is a “relation of the predicate to the subject, categorical” and he regards the hypothetical or disjunctive judgment (based on relations of cause and effect or of the parts of a whole) as concerned with propositions “in relation to each other.”

Aristotle classifies simple propositions by reference to their quantity and quality. In regard to quantity he distinguishes between the universal (*e.g.*, “All men are mortal”) and the particular (*e.g.*, “Some men are mortal”). To these he adds the indefinite proposition which leaves the quantity (*all* or *some*) undetermined. Under the head of quantity, Kant makes a threefold division according to unity, plurality, and totality. He adds the singular proposition “Socrates is mortal” to Aristotle's particular and universal. The difference between the singular on the one hand, and the particular and the universal on the other, seems to be represented in Aristotle's thought by the distinction between propositions about an individual subject and propositions about a universal subject.

The quality of categorical propositions, according to Aristotle, is either affirmative (*i.e.*, positive) or negative, *e.g.*, “All men are mortal” and “Some men are *not* mortal.” To these two Kant adds a third type of judgment under the head of *quality*—the infinite judgment which affirms a negative predicate of a subject, *e.g.*, “The soul is non-mortal.” Though Aristotle recognizes the special character of a term like “non-mortal,” since it is both negative and indefinite, he does not seem to think that the use of such terms affects the quality of a proposition.

Finally, Aristotle divides propositions according to whether they are simple assertions of fact or are assertions qualified by the notions of necessity or contingency (*i.e.*, possibility). Every proposition, he says, “states that something either is or must be or may be the attribute of something else.” The distinction between the necessary and contingent modes of statement has come to be called a difference in “modality,” and statements which have one or another modality are called “modal propositions.”

It is sometimes thought that the Aristotelian classification treats only necessary and contin-

gent propositions, with their several opposites, as modal propositions, and separates the simple or pure assertion from them as non-modal. In contrast to this, Kant makes a threefold division of judgments under the head of modality: the "problematical" (*i.e.*, the possible, what *may be*), the "assertoric" (*i.e.*, the existent, what *is*), and the "apodictic" (*i.e.*, the necessary, what *must be*).

THE CLASSIFICATION of the types of judgment or proposition is usually preliminary in logical analysis to a consideration of their order and connection.

The formal pattern of what is traditionally called "the square of opposition" is determined by the quality and quantity of the simple propositions which are therein related as contradictory, contrary, and sub-contrary. Two propositions are contradictory if they are opposite in both quality and quantity (*e.g.*, "All men are mortal" is contradicted by "Some men are not mortal"). Two universal propositions are contrary if one is affirmative and the other negative (*e.g.*, "All men are mortal" is contrary to "No men are mortal"); and an affirmative and a negative particular proposition are related as sub-contraries (*e.g.*, "Some men are mortal" and "Some men are not mortal"). The significance of these three basic relationships for the truth and falsity of the opposed propositions is discussed in the chapter on OPPOSITION; and in the chapter on NECESSITY AND CONTINGENCY the special problems of opposition among modal propositions are examined.

Other than their opposition, the only formal relationship of propositions or judgments occurs in the structure of inference or reasoning. According to the traditional analysis, the implication of one proposition by another—insofar as that is determined by the form of each—is immediate inference. In contrast, the pattern of *mediated* inference or reasoning always involves at least three propositions, ordered not only with respect to the sequence from premises to conclusion, but also by the relation of the premises to one another. These matters are discussed in the chapter on REASONING.

With respect to their origin, status, or import, judgments or propositions are subject to

further distinctions in type. The certainty or probability with which propositions are asserted or judgments are made is connected by some writers with the distinction between knowledge and opinion, by others with the difference between science and dialectic, and by others with the difference between knowing the relation of ideas and knowing matters of fact or real existence. Propositions which express certain knowledge are, furthermore, divided by some analysts into those which are axiomatic, self-evident, or immediate and those which are known only by mediated inference, reasoning, or demonstration, not by intuition or induction. The former are also sometimes called "principles," the latter "conclusions."

Locke's distinction between "trifling" and "instructive" propositions, like Kant's distinction between "analytic" and "synthetic" judgments, is made in the general context of an examination of how we learn or know.

Trifling propositions, according to Locke, "are universal propositions which, though they be certainly true, yet they add no light to our understanding; bring no increase to our knowledge." All "purely identical propositions" are of this sort—propositions such as "body is body" or "a vacuum is a vacuum." Such propositions "teach nothing but what every one who is capable of discourse knows without being told, *viz.*, that the same term is the same term, and the same idea the same idea." They are all instances of the law of identity; or, as Locke expresses it, they are all "equivalent to this proposition, *viz.*, *what is, is.*" If the trifling proposition, the analytical judgment, or what in our day is called a "tautology," goes beyond the statement of an identity between subject and predicate, it goes no further than the explication of a definition. It predicates, Locke says, "a part of the definition of the word defined," as, for example, in the proposition "Lead is a metal."

Analytical or explicative judgments, Kant says in the *Prolegomena*, "express nothing in the predicate but what has already been actually thought in the concept of the subject . . . When I say, 'all bodies are extended,' I have not amplified in the least my concept of body, but have only analyzed it . . . On the contrary, this judgment, 'All bodies have weight,' contains in

its predicate something not actually thought in the general concept of body; it amplifies my knowledge, by adding something to my concept, and must therefore be called synthetic."

For Locke not all axioms or self-evident propositions are trifling or tautological, for some go beyond statements of identity or the explication of definitions, as, for example, that the whole is greater than the part. Nor are they all useless. Some which Locke distinguishes from the rest by calling them "maxims," are of use, he maintains, "in the ordinary methods of teaching sciences as far as they are advanced, but of little or none in advancing them further. They are of use in disputes, for the silencing of obstinate wranglers, and bringing those contests to some conclusion."

For Kant there is a further division of judgments into the *a posteriori* and the *a priori*, according as their truth is or is not grounded in the data of experience. The former are empirical in origin, the latter transcendental, that is, they have a foundation which transcends experience. These two types of judgment express two corresponding types of knowledge—*a priori* knowledge by which Kant understands "not such as is independent of this or that kind of experience, but such as is absolutely so of all experience. Opposed to this is empirical knowledge, or that which is possible only *a posteriori*, that is, through experience."

In Kant's view, there is no problem about the truth of analytic judgments, for these have an *a priori* foundation in the principle of contradiction. (The contradictory of an analytic judgment is always self-contradictory.) Nor do synthetic judgments which are empirical or *a posteriori* raise any special difficulties. The central question in the theory of knowledge concerns the possibility and validity of synthetic judgments *a priori*.

"If I go out of and beyond the conception A, in order to recognize another, B, as connected with it, what foundation have I to rest on," Kant asks, "whereby to render the synthesis possible? I have here no longer the advantage of looking out in the sphere of experience for what I want. Let us take, for example, the proposition, 'everything that happens has a cause.' In the conception of *something that hap-*

pens, I indeed think an existence which a certain time antecedes, and from this I can derive analytical judgments. But the conception of a cause lies quite outside the above conception, and indicates something entirely different from 'that which happens,' and is consequently not contained in that conception. How then am I able to assert concerning the general conception—'that which happens'—something entirely different from that conception, and to recognize the conception of cause although not contained in it, yet as belonging to it, and even necessarily? What is here the unknown X, upon which the understanding rests when it believes it has found, outside the conception A, a foreign predicate B, which it nevertheless considers to be connected with it?" It is the discovery and solution of this problem which Kant believes to be the signal contribution of his transcendental logic of the judgment.

It may be wondered whether this problem can be stated in terms other than those peculiar to Kant's analytical vocabulary. Other writers admit that propositions which are particular and contingent have "existential import." Their truth concerns real existences, and so whether they are true or not can and must be learned from experience. These are like Kant's synthetic judgments *a posteriori*. Universal and necessary propositions, on the other hand, are sometimes interpreted as having no existential significance. Instead of being read as asserting that anything exists, they are taken simply as statements of the relation between our own ideas. These, for Locke and Hume, are like Kant's *a priori* analytic judgments.

What remains is to discover a parallel for Kant's synthetic judgments *a priori*. In terms other than Kant's, the most likely parallel seems to be the universal and necessary proposition conceived as a statement about reality rather than about relations in the realm of our own concepts. When universal propositions are so interpreted, two questions arise. How do we establish that the subjects of such propositions really exist? What is the ultimate ground for the truth of such propositions, the unlimited universality of which outruns experience? In these two questions we find a problem which is at least analogous to Kant's problem of the possibility of synthetic judgments *a priori*.

OUTLINE OF TOPICS

	PAGE
1. Judgment as an act or faculty of the mind: its contrast with the act of conception or with the faculties of understanding and reason	844
2. The division of judgments in terms of the distinction between the theoretic and the practical	
3. The analysis of practical or moral judgments: judgments of good and evil, means and ends; categorical and hypothetical imperatives	845
4. The distinction between the aesthetic and the teleological judgment	
5. The nature of theoretic judgments	
5a. The linguistic expression of judgments: sentences and propositions	
5b. The judgment as a predication: the classification of subjects and predicates	
5c. The judgment as relational: types of relation	846
6. The division of theoretic judgments according to formal criteria	
6a. The division of judgments according to quantity: universal, particular, singular, and indefinite propositions	
6b. The division of judgments according to quality: positive, negative, and infinite propositions	
6c. The division of judgments according to modality: necessary and contingent propositions; problematic, assertoric, and apodictic judgments	
6d. The classification of judgments by reference to relation: simple and composite propositions; categorical, hypothetical, and disjunctive judgments	
7. The order and connection of judgments	
7a. The formal opposition of judgments: the square of opposition	
7b. The conversion of propositions: the problem of immediate inference	
7c. Reasoning as a sequence of judgments: the chain of reasoning	
8. The differentiation of judgments according to origin, ground, or import	847
8a. Self-evident and demonstrable propositions: immediate and mediated, intuitive and reasoned judgments	
8b. Analytic and synthetic judgments: trifling and instructive propositions	
8c. <i>A priori</i> and <i>a posteriori</i> , non-existential and existential judgments: the problem of <i>a priori</i> synthetic judgments	
8d. The division of judgments into the determinant and the reflective: judgments as constitutive or as regulative	
9. Degrees of assent: certainty and probability	
10. The truth and falsity of judgments	848

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Judgment as an act or faculty of the mind: its contrast with the act of conception or with the faculties of understanding and reason

Chapter 42: JUSTICE

INTRODUCTION

THE discussion of justice is the central theme in two dialogues of Plato—the *Republic* and the *Gorgias*. The dispute between Socrates and Thrasymachus in the one and between Socrates and Callicles in the other is of such universal scope and fundamental character that it recurs again and again in the great books with little change except in the personalities and vocabularies of the disputants.

It is a conflict of such polar opposites that all other differences of opinion about justice became arguable only after one or the other of the two extreme positions is abandoned. It is the conflict between the exponents of might and the exponents of right—between those who think that might *makes* right and that justice *is* expediency, and those who think that power can be wrongly as well as rightly exercised and that justice, the measure of men and states, cannot be measured by utility.

Though Plato gives us the first full-fashioned statement of this issue, he does not fashion it out of whole cloth. The issue runs through the fabric of Greek life and thought in the age of the imperialistic city-states which played the game of power politics culminating in the Peloponnesian War. In his history of that war, Thucydides highlights the Melian episode by dramatically constructing a conversation between the Athenian envoys and the representatives of Melos, a little island colony of Sparta which had refused to knuckle under to Athenian aggression.

Recognizing the superior force of the aggressors, the Melians enter the conference with a sense of its futility, for, as they point out, if they insist upon their rights and refuse to submit, they can expect nothing from these negotiations except war and, in the end, slavery. The Athenians reply with a frankness that is seldom found in the diplomatic exchanges of our own

day, though in their real contentions the conferences which have preceded or followed the world wars of our century repeat what happened, if not what was said, at Melos.

The Athenians tell the Melians that they will not waste time with specious pretences "either of how we have a right to our empire . . . or are now attacking you because of a wrong you have done us." Why make a long speech, they say, which would not be believed? Instead they come directly to the point and put the matter simply or, as we now say, realistically. "You know as well as we do," they tell the Melians, "that right, as the world goes, is only in question between equals in power, whereas the stronger do whatever they can and the weaker suffer whatever they must." There is nothing left for the Melians except an appeal to expediency. "You debar us from talking about justice and invite us to obey your interest," they reply to the Athenians, before trying to persuade them that their policy will end in disaster for Athens.

The language of Thrasymachus in the *Republic* resembles that of the Athenian envoys. "I proclaim," he says, "that justice is nothing else than the interest of the stronger. . . . The different forms of government make laws democratical, aristocratical, tyrannical, with a view to their several interests; and these laws, which are made by them for their own interests, are the justice which they deliver to their subjects, and him who transgresses them they punish as a breaker of the law, and unjust. And this is what I mean when I say that in all states there is the same principle of justice which is the interest of the government; and as the government must be supposed to have power, the only reasonable conclusion is that everywhere there is one principle of justice which is the interest of the stronger."

The thesis seems to have two applications. For the stronger, it means that they have the right, as far as they have the might, to exact from the weaker whatever serves their interests. Their laws or demands cannot be unjust. They cannot do injustice. They can only fail to exert sufficient might to hold on to the power which can secure them, not from the charge of injustice, but from reprisals by those whom they have oppressed or injured.

The thesis also means, for the weaker, that they can only do injustice but not suffer it. Injustice on their part consists in disobeying the law of their rulers. Hence for them, too, justice is expediency, only now in the sense that they are likely to suffer if they try to follow their own interests rather than the interests of the stronger.

This thesis appears to be repeated in somewhat different language by Hobbes and Spinoza. To men living in a purely natural condition, the notions of justice and injustice do not apply. They apply only to men living in civil society. "Where there is no Commonwealth," Hobbes writes, "there is nothing unjust. So that the nature of justice consists in the keeping of valid covenants; but the validity of covenants begins not but with the constitution of a civil power sufficient to compel men to keep them." The breach of civil laws or covenants "may be called injustice, and the observance of them justice."

It is Spinoza's opinion that "everything has by nature as much right as it has power to exist and operate." It follows, therefore, that "in a natural state there is nothing which can be called just or unjust, but only in a civil state." Here as before justice consists in obedience, injustice in disobedience, to whatever laws the state has the power to enforce, the laws themselves being formulated not by reference to justice, but to the interests of the state which must seek its own preservation and has the right to do so, so long as it has the power.

THOSE WHO TAKE the opposite view agree that justice is political in the sense that the state, in organization and operation, is a work of justice. Wisdom is the virtue of the rulers in the *Republic*, but justice is the organizing principle of Plato's ideal state.

Aristotle maintains that man is a political animal, whereas other animals are merely gregarious. He cites the fact that man alone has a power of speech able to communicate opinions about the expedient and the just. "Justice is the bond of men in states, for the administration of justice, which is the determination of what is just, is the principle of order in political society." Aristotle describes man "when separated from law and justice" as the worst of animals. Augustine describes the state without justice as "no better than a band of robber thieves."

Those who agree that political institutions involve justice are confronted by these alternatives: *either* the principle of justice is antecedent to the state, its constitution, covenants, and laws, *or* the determination of what is just and unjust is entirely relative to the constitution of a state, dependent upon its power, and consequent to its laws.

When the second alternative is chosen, the proposition that justice is political is seriously qualified. It is *merely* political. There is no natural justice, no justice apart from man-made laws, nothing that is just or unjust in the very nature of the case and without reference to civil institutions. On this theory, only the individual who is subject to government can be judged just or unjust. The government itself cannot be so judged, nor can its constitution, its laws, or its acts; for, since these determine what is just and unjust, they cannot themselves be judged for their justice.

The opposite answer conceives political justice as a determination of natural justice. "Political justice," Aristotle remarks, "is partly natural and partly conventional or legal." The fact that there is a sense in which just action on the part of a citizen consists in law-abiding conduct, does not exclude another sense in which the laws themselves can be called just or unjust, not only the laws, but the constitution of the state itself. Though the justice of civil laws is partly relative to the constitution under which they are made and administered, there are some enactments which, since they violate natural justice, cannot be justified under any constitution. The constitution, moreover, cannot be regarded as the ultimate standard of justice by those who compare the justice of different forms of government or diverse constitutions. On

their view, the ultimate measure of justice in all human institutions and acts, as well as in the characters of men, is not itself a man-made standard, but rather a natural principle of justice, holding for all men at all times everywhere.

THE ISSUE JOINED BY these two theories of justice extends by implication into many related matters. The opposition, for example, between those who affirm the reality of natural law as the source of legality in all civil regulations and those who derive the legality of positive laws from the will of the sovereign alone, is considered in the chapter on LAW, but its parallelism with the issue of natural and conventional justice should be noted here.

Those who deny natural justice and natural law also tend to deny natural rights, which, unlike civil rights, are not conferred on the individual by the state, but are inherent in his human personality. They are, according to the Declaration of Independence, "unalienable" in the sense that the state cannot rescind them. What the state does not create, it cannot destroy. If a government transgresses natural rights, it negates its own reason for being, since it is "to secure these rights [that] governments are instituted among men."

Those who deny natural rights, among which the right to liberty is usually included, do not have a standard for judging when governments violate the rights and invade the liberties of men. When men are thought to have no rights except those granted by their rulers, the absolute power which the rulers exercise cannot be criticized as tyrannical or despotic.

Considering the situation of men in what he calls "a state of perfect freedom"—apart from government and civil institutions—Locke says of this state of nature that it "has a law of nature to govern it, which obliges everyone; and reason, which is that law, teaches all mankind who will but consult it, that, being all equal and independent, no one ought to harm another in his life, health, liberty, or possessions. . . . Everyone, as he is bound to preserve himself, and not quit his station willfully, so, by the like reason, when his own preservation comes not in competition, ought he, as much as he can, to preserve the rest of mankind, and not, unless it be to do justice on an offender, take away or

impair the life, or what tends to the preservation of the life, the liberty, health, limb, or goods of another." Since this law of nature, and its implied principle of just dealing between men, is not abolished when men associate in the common life of a civil society, natural justice and natural rights remain, according to Locke and others, to limit the powers of government and to measure the justice of its laws.

The principle of natural justice is sometimes not accompanied by a doctrine of natural law and natural rights, as for example in Greek thought. Their connection first seems to occur in Roman jurisprudence and mediaeval theory. Not all the opponents of natural justice avoid the use of the words "natural law" and "natural rights." Using these words in a different sense, Hobbes, for example, speaks of men living under natural law in a state of nature, which is "a condition of war of every one against every one," and "in such condition every man has a right to everything, even to another's body." Only when men *abandon* this unlimited right in order to form a commonwealth, do they acquire in recompense certain civil rights or, as Hobbes says, "proprieties." Then, and only then, can there be any meaning to justice, conceived according to the ancient maxim which Hobbes accepts, that justice is "the constant will to render to each man what is his due."

Both Spinoza and Hume make the same point. Where there is no recognized title to property, or *legally established* right, there can be no justice—no respecting of what is a man's own or giving him what belongs to him. The difference between Locke and these others seems to lie in his conception of *property* as the natural right which a man has to the preservation of his life, liberty, and estate. There can be justice, therefore, between men in a state of nature, for even then each has some property that the others are bound to respect.

THE MEANING of natural justice can be examined apart from these different interpretations of the so-called "state of nature." Those who, like Aristotle and Aquinas, do not conceive the origin of political society as a transition from the "state of nature" do, nevertheless, appeal to a principle of natural justice. For Aquinas, this principle seems to be an integral

part of the natural law. Sometimes the statement of the first precept of the natural law is "Seek the good; avoid evil." Sometimes it is "Do good to others, injure no one, and render to every man his own." In this second formulation, the natural law seems to be identical with the precept of justice. The essential content of this precept seems to be present—separate from any doctrine of natural law—in Aristotle's analysis of the nature of justice both as a virtue and as a quality of human acts.

"The just," Aristotle says, "is the lawful and the fair." What he means by the word "lawful" in this context does not seem to be simply the law-abiding, in the sense of conforming to the actual laws of a particular society. He thinks of law as aiming "at the common advantage. . . . We call those acts just," he writes, "that tend to produce and preserve happiness and its components for the political society." Lawful (or just) actions thus are those which are for the common good or the good of others; unlawful (or unjust) actions, those which do injury to others or despoil the society.

It is in this sense of justice that both Plato and Aristotle lay down the primary criterion for differentiating between good and bad governments. Those which are lawful and serve the common good are just; those which are lawless and serve the private interests of the rulers are unjust. This meaning of justice applies as readily to all citizens—to all members of a society—as it does to those who have the special duties or occupy the special offices of government.

Whether it is stated in terms of the good of other individuals or in terms of the common good of a community (domestic or political), this understanding of justice seems to consider the actions of a man as they affect the well-being, not of himself, but of others. "Justice, alone of the virtues," says Aristotle, "is thought to be 'another's good,' because it is related to our neighbor." Concerned with what is due another, justice involves the element of duty or obligation. "To each one," Aquinas writes, "is due what is his own," and "it evidently pertains to justice," he adds, "that a man give another his due." That is why "justice alone, of all the virtues, implies the notion of duty." Doing good to others or not injuring them, when

undertaken as a matter of strict justice, goes no further than to discharge the debt which each man owes every other.

In consequence, a difference of opinion arises concerning the adequacy of justice to establish the peace and harmony of a society. Some writers, like Kant, seem to think that if perfect justice obtained, a multitude of individual wills would be perfectly harmonized in free action. Others, like Aquinas, think justice necessary but insufficient precisely because it is a matter of duty and debt. "Peace," he writes, "is the *work of justice* indirectly, in so far as justice removes the obstacles to peace; but it is the *work of charity* directly, since charity, according to its very nature, causes peace; for love is a *unitive force*." The bonds of love and friendship unite men where justice merely governs their interaction. What men do for one another out of the generosity of love far exceeds the commands of justice. That is why mercy and charity are called upon to qualify justice or even to set it aside. "Earthly power," Portia declares in the *Merchant of Venice*, "doth then show likest God's when mercy seasons justice."

THE PRECEPT "to render unto others what is their due" is read in a different light when the other aspect of justice is considered. When the just is conceived as the fair, the fairness which is due ourselves or others applies, not to benefit and injury generally, but to the exchange and distribution of goods or burdens. What is the principle of a fair exchange or a fair distribution? Aristotle's answer to this question is in terms of equality.

In the transactions of commerce, fairness seems to require the exchange of things equivalent in value. The rule of an eye for an eye, a tooth for a tooth, is another expression of the principle of equality as the criterion of a fair penalty or a just compensation. If honors or rewards are to be distributed, equals should in fairness be treated equally, and those who are unequal in merit should receive unequal shares. For all to share alike is not a just distribution of deserts if all do not deserve alike. "Awards should be 'according to merit,'" Aristotle writes. He claims that "all men agree" with this, "though they do not all specify the same sort of merit, but democrats identify it with

the status of freeman, supporters of oligarchy with wealth or with noble birth, and supporters of aristocracy with excellence." The unequal treatment of unequals, however, still derives its fairness from the principle of equality, for there is an equivalence of ratios in the proportion of giving more to the more deserving and less to the less.

Aristotle employs the distinction between these modes of equality—arithmetic and geometric, or simple and proportional, equality—to define the difference between fairness in exchange and fairness in distribution. The one is the type of justice which is traditionally called "commutative," "corrective," or "remedial," the other "distributive."

The type of justice "which plays a rectifying part in transactions between man and man," Aristotle further divides into two kinds. "Of transactions," he writes, "(1) some are voluntary and (2) others involuntary—voluntary such transactions as sale, purchase, loan for consumption, pledging, loan for use, depositing, letting . . . while of the involuntary (a) some are clandestine, such as theft, adultery, poisoning, procuring, enticement of slaves, assassination, false witness, and (b) others are violent, such as assault, imprisonment, murder, robbery with violence, mutilation, abuse, insult." The sphere which Aristotle assigns to commutative or corrective justice thus appears to cover both criminal acts and civil injuries. But, as applied to civil injuries, the principle of fairness in exchange usually involves a payment for damages, restitution, or compensation in kind; whereas the principle of commutative justice as applied to criminal wrongdoing usually calls for a punishment somehow equalized in severity to the gravity of the offense. This last is the principle of the *lex talionis*—an eye for an eye, a life for a life. The problems of justice which it raises are considered in the chapter on PUNISHMENT.

JUSTICE IS SOMETIMES divided into economic and political according as, on the one hand, fairness or equalization concerns the kind of goods which originate with the expenditure of labor, or as, on the other hand, it involves the status of men in the state. The difference between these two modes of justice seems to be largely

dependent upon the kind of transaction to which the principle of justice is applied. The forms of justice—the two modes of equality or fairness—appear to remain the same. The special problems of economic justice are more fully examined in the chapters on LABOR and WEALTH, as the special problems of political justice are treated in greater detail in all the chapters dealing with the state, government, and the several forms of government. Here we shall consider only the generalities, and especially those which touch the main issues in the theory of justice.

Though Karl Marx does not engage in the controversy over natural justice, he seems to take the side which looks upon justice as a universal standard that does not derive from, but rather measures, human institutions. Something like 'from each according to his ability, to each according to his needs'—or, in another variant of the maxim, 'to each according to his deserts'—seems to be for Marx the maxim of a just economy, stated without argument as if a principle self-evident in the very nature of the case. So, too, in his consideration of the exploitation of labor in its various historic forms—chattel slavery, feudal serfdom or agrarian peonage, and what he calls "wage slavery" under industrial capitalism—Marx assumes that a clear and unquestionable principle of justice is being violated when the goods produced by the labor of one man enrich another disproportionately to that other's contribution or desert. Such basic words in *Capital* as "expropriation," "exploitation," and "unearned increment" seem never to be simply terms of description, but of evaluation. Each implies a specific injustice.

The labor theory of value, the origin of which he attributes to Adam Smith, Marx conceives as solving a problem in justice which Aristotle stated but did not solve. He refers to the chapter in the book on justice in Aristotle's *Ethics*, in which Aristotle discusses money as a medium to facilitate the exchange of commodities. Money permits so many units of one commodity to be equated with so many units of another. But the problem is how to determine equivalents in the exchange of unlike things, apparently incommensurable in value. How can the value of a house be commensurated with the

value of a bed, so that an equality in value can be set up between a house and a certain number of beds? Abstracting entirely from considerations of supply and demand, the determination of a just exchange or a fair price requires an equation of comparable quantities.

Aristotle tells us, Marx points out, why he found the problem insoluble. "It was the absence of any concept of value. What is that equal something, that common substance, which admits of the value of beds being expressed by a house? Such a thing, in truth, cannot exist, says Aristotle. And why not? Compared with beds, the house does represent something equal to them, in so far as it represents what is really equal, both in the beds and the house. And that is—human labor. . . . The brilliancy of Aristotle's genius is shown by this alone, that he discovered, in the expression of the value of commodities, a relation of equality. The peculiar conditions of the society in which he lived alone prevented him from discovering what, 'in truth,' was at the bottom of this equality."

We cannot help noting the character of the labor theory of value as an analysis not only of justice in exchange, but also of just compensation to labor for its productivity. The principle of justice here employed seems to be the same as that underlying the mediaeval condemnation of interest as unjust or usurious, or the later effort to discriminate between just and unjust interest rates. The principle even seems to be implicitly involved in Adam Smith's distinction between real or natural price and the market price which fluctuates with variations in supply and demand.

When the economic problem is one of distribution rather than exchange, another standard of fairness—the proportional equality of distributive justice—becomes relevant.

The assumption of a primitive possession of all things in common, especially land and its resources, is the background against which such thinkers as Aquinas and Hobbes, Locke and Rousseau, Montesquieu and Hegel, Adam Smith and Karl Marx consider the origin or justification of private property. Insofar as the question is one of justification, rather than of actual historic origin, the division of common holdings into privately held shares is a matter of justice in distribution. In the opinion of many, a just

distribution would recognize that labor alone entitles a man to claim possession of the raw materials improved by his work and of the finished products of that work.

The other face of the problem assumes an existing inequitable distribution. It is then asked how this can be rectified by some method of redistributing wealth more justly; or it is proposed that the whole system of private property be reformed in the direction of public ownership of the means of production, as the basis for a just distribution of the fruits of human productivity.

THE CONNECTION which has become evident between justice and both liberty and equality does not imply that these three basic notions are simply coordinate with one another. On the contrary, equality seems to be the root of justice, at least insofar as it is identified with fairness in exchange or distribution; and justice in turn seems to be the foundation, not the consequence of liberty.

The condemnation of slavery confirms this observation. If slavery were not unjust, the slave would have no right to be free. The injustice of treating a man as a chattel ultimately rests on the equality between him and his master as human beings. His right to the same liberty which his master enjoys stems from that equality. The justice of equal treatment for equals recognizes that right and sets him free. Aristotle's theory of natural slavery is based on a supposition of natural inequality which is thought to justify the enslavement of some men and the freedom of others. Whenever slavery is justified or a criminal is justly imprisoned, neither the slave nor the criminal is regarded as deprived of any liberty to which he has a right.

It would seem to follow that if a man is justly treated, he has all the liberty which he deserves. From the opposite angle, Mill argues that a man is entitled to all the liberty that he can use justly, that is, use without injuring his fellow man or the common good. More liberty than this would be license. When one man encroaches on the rights of others, or inflicts on them "any loss or damage not justified by his own rights," he is overstepping the bounds of liberty and is, according to Mill, a fit object "of

moral reprobation, and, in grave cases, of moral retribution and punishment."

The various relations of liberty to justice, and of both to law, are considered in the chapters on LIBERTY and LAW. All the writers who make the distinction between government by law and government by men fundamental in their political theory also plainly express a preference for the former on grounds both of justice and liberty.

Absolute government, which violates the equality of men, unjustly subjects them, even when it does not through tyranny enslave them. The benevolence of the despot ruling for the common good has one aspect of justice, but there are other aspects of political justice which can be achieved, as Mill points out, only if "despotism consents not to be despotism . . . and allows the general business of government to go on as if the people really governed themselves." The greater justice of constitutional government consists in its granting to men who deserve the equal freedom of equals, the equality of citizenship—an equality under the law which levels those citizens who happen to hold public office with those in private life.

The major controversy over the several forms of constitutional government turns on a third point of justice. The defenders of democracy and oligarchy each contend that equalities or inequalities in birth or wealth justify a broader or a narrower franchise. It is Mill again who insists that nothing less than universal suffrage provides a just distribution of the political status of citizenship, and that "it is a personal injustice to withhold from anyone, unless for the prevention of greater evils, the ordinary privilege of having his voice reckoned in the disposal of affairs in which he has the same interest as other people."

Of the three points of justice which seem to be involved in the comparison of forms of government, only the first (concerned with whether political power is exercised for the common good or the ruler's private interests) is not recognizable as a matter of distributive justice. Yet even here the requirement that the ruler should treat the ruled as ends rather than as means derives from a fundamental equality between ruler and ruled. The injustice of tyranny lies in a violation of this equality.

ONE MEANING of justice remains to be considered. It is related to all the foregoing considerations of economic and political justice, of just constitutions, just laws, and just acts. It is that meaning of justice in which a man is said to be just—to possess a just will, to be just in character, to have the virtue of justice. Here difference in theory reflects the difference between those moralists for whom virtue is the basic conception, and those who, like Kant, emphasize duty or who, like Mill, reduce the propensity for justice to a moral sentiment. But even among those who treat justice as a virtue, there seems to be a profound difference in analysis.

For Aristotle, the virtue of justice, like other moral virtues, is a habit of conduct. It differs from courage and temperance in that it is a habit of action, not of the passions. It is not a rationally moderated tendency of the emotions with regard to things pleasant and painful. It is that settled inclination of the will "in virtue of which the just man is said to be a doer, by choice, of that which is just, and one who will distribute either between himself and another or between two others not so as to give more of what is desirable to himself and less to his neighbor (and conversely with what is harmful), but so as to give what is equal in accordance with proportion."

Another difference between justice and the other moral virtues is that courageous and temperate acts are performed only by courageous and temperate men, whereas an act which is outwardly just can be done by an unjust man as well as by a just one.

Fair dealing in the exchange or distribution of goods, determined by objective relations of equality, is the substance of justice as a special virtue; but there is in addition what Aristotle calls "general" as opposed to "special" justice. Aristotle calls the general virtue of justice "complete virtue," because "he who possesses it can exercise his virtue not only in himself but towards his neighbor also." It embraces all the moral virtues insofar as their acts are directed to the good of others.

"Justice in this sense," he goes on to say, "is not a part of virtue, but virtue entire"; whereas special justice—the justice of distributions and exchanges—is merely a part of moral virtue,

merely one particular virtue. Yet special justice, no less than general justice, is a social virtue. The difference between the way each directs actions toward the good of others seems to be like the difference between the lawful and the fair, or the difference between the common good of society as a whole and the good of other individuals.

The thoroughly social conception of justice in Aristotle may have some parallel in the meaning of justice in Plato's *Gorgias* (where the question is whether it is better to suffer than to do injustice), but the definition of justice as a virtue in the *Republic* does not express or develop the social reference. In the state as in the soul, justice is a fitting disposition or harmonious order—of the several classes of men in the state, of the several virtues in the soul. The just state is not described as acting justly toward other states, nor is the just man pictured as a doer of good deeds. Rather the picture of the soul in which justice resides is one of interior peace or spiritual health—the well-being of happiness.

"Justice," Socrates declares, is concerned "not with the outward man, but with the inward, which is the true self and concernment of man: for the just man does not permit the several elements within him to interfere with one

another, or any of them to do the work of others—he sets in order his own inner life, and is his own master and his own law, and at peace with himself." His is "one entirely temperate and perfectly adjusted nature."

This conception of justice bears a certain resemblance to what the Christian theologians mean by "original justice." The perfect disposition of Adam's soul in a state of supernatural grace consisted, according to Aquinas, in "his reason being subject to God, the lower powers to reason, and the body to the soul—the first subjection being the cause of both the second and the third, since while reason was subject to God, the lower powers remained subject to reason." The justice of man's obedience to God seems to be inseparable from the injustice internal to his own members.

The way in which justice is discussed in the *Gorgias* may similarly be inseparable from the way it is defined in the *Republic*. Certainly Callicles will never understand why it is always better to suffer injustice than to do it, unless Socrates succeeds in explaining to him that the man who is wronged suffers injury in body or in external things, while the man who does wrong injures his own soul by destroying what, to Socrates, is its greatest good—that equable temper from which all fitting actions flow.

OUTLINE OF TOPICS

1. Diverse conceptions of justice	PAGE 859
1a. Justice as the interest of the stronger or conformity to the will of the sovereign	
1b. Justice as harmony or right order in the soul: original justice	
1c. Justice as a moral virtue directing activity in relation to others and to the community: the distinction between the just man and the just act	860
1d. Justice as the whole of virtue and as a particular virtue: the distinction between the lawful and the fair	
1e. Justice as an act of will or duty fulfilling obligations to the common good: the harmonious action of individual wills under a universal law of freedom	
1f. Justice as a custom or moral sentiment based on considerations of utility	
2. The precepts of justice: doing good, harming no one, rendering to each his own, treating equals equally	
3. The duties of justice compared with the generosity of love and friendship	861
4. The comparison of justice and expediency: the choice between doing and suffering injustice; the relation of justice to happiness	862

	PAGE
5. Justice and equality: the kinds of justice in relation to the measure and modes of equality and inequality	862
6. Justice and liberty: the theory of human rights	863
6a. The relation of natural rights to natural law and natural justice	
6b. The relation between natural and positive rights, innate and acquired rights, private and public rights: their correlative duties	
6c. The inalienability of natural rights: their violation by tyranny and despotism	864
6d. Justice as the basis for the distinction between liberty and license	
6e. Justice and natural rights as the source of civil liberty	
7. Domestic justice: the problems of right and duty in the family	865
8. Economic justice: justice in production, distribution, and exchange	866
8a. Private and public property: the just distribution of economic goods	
8b. Fair wages and prices: the just exchange of goods and services	867
8c. Justice in the organization of production	868
(1) Economic exploitation: chattel slavery and wage slavery	
(2) Profit and unearned increment	
8d. Justice and the use of money: usury and interest rates	
9. Political justice: justice in government	869
9a. The natural and the conventional in political justice: natural law and the general will	
9b. Justice as the moral principle of political organization: the bond of men in states	
9c. The criteria of justice in various forms of government and diverse constitutions	870
9d. The relation of ruler and ruled: the justice of the prince or statesman and of the subject or citizen	
9e. The just distribution of honors, ranks, offices, suffrage	871
9f. Justice between states: the problem of right and might in the making of war and peace	872
9g. The tempering of political justice by clemency: amnesty, asylum, and pardon	873
10. Justice and law	
10a. The measure of justice in laws made by the state: natural and constitutional standards	
10b. The legality of unjust laws: the extent of obedience required of the just man in the unjust society	874
10c. The justice of punishment for unjust acts: the distinction between retribution and vengeance	
10d. The correction of legal justice: equity in the application of human law	875
11. Divine justice: the relation of God or the gods to man	876
11a. The divine government of man: the justice and mercy of God or the gods	
11b. Man's debt to God or the gods: the religious acts of piety and worship	877

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 43: KNOWLEDGE

INTRODUCTION

KNOWLEDGE, like being, is a term of comprehensive scope. Its comprehensiveness is, in a way, correlative with that of being. The only thing which cannot be an object of knowledge or opinion, which cannot be thought about in any way except negatively, is that which has no being of any sort—in short, *nothing*. Not all things may be knowable to us, but even the skeptic who severely limits or completely doubts man's power to know is usually willing to admit that things beyond man's knowledge are in themselves knowable. Everyone except Berkeley would agree that the surfaces of bodies which we cannot see are not, for that reason, in themselves invisible.

The consideration of knowledge extends, therefore, to all things knowable, to all kinds of knowers, to all the modes of knowledge, and all the methods of knowing. So extensive an array of topics exceeds the possibility of treatment in a single chapter and requires this chapter to be related to many others.

The Cross-References which follow the References indicate the other chapters which deal with particulars we cannot consider here. For example, the nature of history, science, philosophy, and theology, and their distinction from one another, are treated in the chapters devoted to those subjects. So, too, the chapters on metaphysics, mathematics, physics, mechanics, and medicine deal with the characteristics and relations of these special sciences. The psychological factors in knowing—the faculties of sense and mind, of memory and imagination, the nature of experience and reasoning—also have their own chapters. Still other chapters deal with the logical elements of knowledge, such as idea and judgment, definition, hypothesis, principle, induction, and reasoning, logic and dialectic.

THE PROGRAM which Locke sets himself in his *Essay Concerning Human Understanding* is often taken to include the basic questions about knowledge. His purpose, he tells us, is "to inquire into the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent." Two other matters, not explicitly mentioned by Locke in his opening pages, assume central importance in the fourth book of his essay. One is the question about the nature of knowledge itself. The other concerns the kinds of knowledge.

It may be thought that certain questions are prior to these and all others. Is knowledge possible? Can we know anything? The man the skeptic challenges is one who thinks that knowledge is attainable and who may even claim to possess knowledge of some sort. But the issue between the skeptic and his adversaries cannot be simply formulated. Its formulation depends in part upon the meaning given knowledge and the various things with which it is sometimes contrasted, such as belief and opinion, or ignorance and error. It also depends in part on the meaning of truth and probability. It would seem, therefore, that some consideration of the nature of knowledge should precede the examination of the claims concerning knowledge which provoke skeptical denials.

The theory of knowledge is a field of many disputes. Most of the major varieties of doctrine or analysis are represented in the tradition of the great books. But the fact that knowledge involves a relationship between a knower and a known seems to go unquestioned. William James expresses this insight, perhaps more dogmatically than some would allow, in the statement that knowledge "is a thoroughgoing dualism. It supposes two elements, mind knowing and thing known . . . Neither gets out of itself or into the other, neither in any way *is* the other,

neither *makes* the other. They just stand face to face in a common world, and one simply knows, or is known unto, its counterpart." This remains true even when attention is turned to the special case of knowledge about knowledge or the knower knowing himself. The mind's examination of itself simply makes the mind an object to be known as well as a knower.

This suggests a second point about the nature of knowledge which seems to be undisputed. If knowledge relates a knower to a known, then what is somehow possessed when a person claims to have knowledge, is the object known. It does not seem possible for anyone to say that he knows something without meaning that he *has* that thing *in mind*. "Some sort of signal," James writes, "must be given by the thing to the mind's brain, or the knowing will not occur—we find as a matter of fact that the mere *existence* of a thing outside the brain is not a sufficient cause for our knowing it: it must strike the brain in some way, as well as be there, to be known." What is not in any way present to or represented in the mind is not known in any of the various senses of the word "know." What the mind cannot reach to and somehow grasp cannot be known. The words which are common synonyms for knowing—"apprehending" and "comprehending"—convey this sense that knowledge somehow takes hold of and surrounds its object.

That knowledge is a kind of possession occasions the comparisons which have been made between knowledge and love. The ancients observed that likeness and union are involved in both. Plato, for example, suggests in the *Symposium* that both the knower and the lover strive to become one with their object. "Love is also a philosopher," Diotima tells Socrates, and, as "a lover of wisdom," the philosopher is also a lover.

With regard to some objects, love and knowledge are almost inseparable. To know them is to love them. But this does not hold for all objects, nor does the inseparability of knowledge and love in certain cases prevent their analytical distinction in all. Like is known by like, but unlikes attract each other. Furthermore, according to one theory of knowledge, expounded by Aquinas, the knower is satisfied to possess an image of the thing to be known. This image

provides the likeness through which knowledge occurs; and thus, Aquinas writes, "the idea of the thing understood is in the one who understands." The lover, on the other hand, is "inclined to the thing itself, as existing in itself." He seeks to be united with it directly. The nobility or baseness of the object known does not affect the knower as the character of the object loved affects the lover. This understanding of the difference between knowledge and love leads Aquinas to say that "to love God is better than to know God; but, on the contrary, to know corporeal things is better than to love them."

The principle of likeness between knower and known does not go undisputed. On the contrary, the opposite views here form one of the basic issues about the nature of knowledge. The issue is whether the thing known is actually present to the knower, existing in the mind or consciousness exactly as it exists in itself; or whether the thing is represented in the mind by a likeness of itself, through which the mind knows it. In this view, the mode of existence of the thing outside the mind is different from the way in which its representative exists in the mind.

Berkeley, at one extreme, identifies being and being known. "As to what is said of the absolute existence of unthinking things without any relation to their being perceived, that seems perfectly unintelligible," he writes. "Their *esse* is *percipi*, nor is it possible they should have any existence, out of the minds or thinking things which perceive them."

At the other extreme are those like Kant for whom the thing in itself is unknowable precisely because there can be no resemblance between the phenomenal order of objects represented under the conditions of experience and the noumenal order of the unconditioned. "All conceptions of things in themselves," he writes, "must be referred to intuitions, and with us men these can never be other than sensible, and hence can never enable us to know objects as things in themselves but only as appearances. . . . The unconditioned," he adds, "can never be found in this chain of appearances."

In between these extremes there are those who agree that things exist apart from being known without ceasing to be knowable, but who nevertheless differ with respect to whether

the thing exists in reality in the same way that it exists in the mind. The several forms of idealism and realism, distinguished in the chapter on IDEA, mark the range of traditional differences in the discussion of this difficult problem.

FOR ANY THEORY of what knowledge is there is a distinction between knowledge and ignorance—between having or not having something in mind. Nor does anyone confuse ignorance and error. The mind in error claims to know that of which, in fact, it is ignorant. This, as Socrates points out in the *Meno*, makes it easier to teach a person aware of his ignorance than a person in error; for the latter, supposing himself to know, resists the teacher. Hence getting a person to acknowledge ignorance is often the indispensable first step in teaching.

But though the difference between knowledge and ignorance and that between ignorance and error seems to be commonly understood, it does not follow that everybody similarly agrees upon the difference between knowledge and error. This much is agreed, that to know is to possess the truth about something, whereas to err is to be deceived by falsity mistaken for truth. The disagreement of the philosophers begins, however, when the meaning of truth and falsity is examined.

Truth is one thing for those who insist upon some similarity between the thing known and that by which it is known or represented in the mind. It is another for those who think that knowledge can be gained without the mediation of images or representations. In the first case, truth will consist in some kind of correspondence between what the mind thinks or understands and the reality it tries to know. In the other, truth will be equivalent to consistency among the mind's own ideas.

The examination of this fundamental disagreement is reserved for the chapter on TRUTH. Here the identification of knowing with having the truth calls for the consideration of another distinction, first made by Plato. In his language, as in that of Aristotle and others, it is the difference between knowledge and opinion. Sometimes, as with Locke, a similar distinction is made in terms of knowledge and judgment; sometimes it is made in terms of knowledge and belief; sometimes in terms of adequate and

inadequate, or certain and probable, knowledge.

The difference between these opposites, unlike that between knowledge and error, is not a matter of truth and falsity. There is such a thing as "right opinion," according to Socrates, and it is "not less useful than knowledge." Considering the truth so far as it affects action, Socrates claims that the man with right opinion "will be just as good a guide if he thinks the truth, as he who knows the truth." The difference between right opinion and knowledge is here expressed by the contrast between the words "thinks" and "knows." It does not consist in the truth of the conclusion, but in the way that conclusion has been reached or is held by the mind.

The trouble with right opinion as compared with knowledge, Socrates explains, is that it lacks stability and permanence. Right opinions are useful "while they abide with us . . . but they run away out of the human soul and do not remain long, and therefore they are not of much value until they are fastened by the tie of the cause"—or, in other words, until they are fixed in the mind by the reasons on which they are grounded. "When they are bound," Socrates declares, "they have the nature of knowledge and . . . they are abiding."

At this point in his conversation with Meno, Socrates makes the unusual confession that "there are not many things which I profess to know, but this is most certainly one of them," namely, that "knowledge differs from true opinion." It may be that Socrates claims to know so little because he regards knowledge as involving so much more than simply having the truth, as the man of right opinion has it. In addition to having the truth, knowledge consists in seeing the reason why it is true.

This criterion can be interpreted to mean that a proposition which is neither self-evident nor demonstrated expresses opinion rather than knowledge. Even when it happens to be true, the opinion is qualified by some degree of doubt or some estimate of probability and counter-probability. In contrast, when the mind has adequate grounds for its judgment, when it knows that it knows and why, it has the certainty of knowledge.

For some writers, such as Plato, certitude is as inseparable from knowledge as truth is. To speak of "a false knowledge as well as a true" seems to him impossible; and "uncertain knowledge" is as self-contradictory a phrase as "false knowledge."

Others use the word "knowledge" more loosely to cover both adequate and inadequate knowledge, the probable as well as the certain. They make a distinction within the sphere of knowledge that is equivalent to the distinction between knowledge and opinion.

Spinoza, for example, distinguishes three kinds of knowledge. He groups the perception of individual things through the bodily senses, which he calls "knowledge from vague experience," with knowledge "from signs" which depends on ideas formed by the memory and imagination. "These two ways of looking at things," he writes, "I shall hereafter call knowledge of the first kind—opinion or imagination." In contrast, that which is derived "from our possessing common notions and adequate ideas of the properties of things," he calls "reason and knowledge of the second kind."

The third kind, which he calls "intuitive science," is that sort of knowing which "advances from an adequate idea of certain attributes of God to the adequate knowledge of the essence of things." Knowledge of the second and third kinds, he maintains, "is necessarily true." That there can be falsity in the first kind, and only there, indicates that it is not genuinely knowledge at all, but what other writers would insist upon calling "opinion."

The several meanings of the word "belief" are determined by these distinctions. Sometimes belief is associated with opinion, sometimes with knowledge, and sometimes it is regarded as an intermediate state of mind. But in any of these meanings belief stands in contrast to make-believe, and this contrast has a bearing on knowledge and opinion as well. To know or to opine puts the mind in some relation to the real or actual rather than the merely possible, and subjects it to the criteria of truth and falsity. The fanciful or imaginary belongs to the realm of the possible (or even the impossible) and the mind in imagining is fancy-free—free from the restraints and restrictions of truth and reality.

SKEPTICISM in its most extreme form takes the position that there is nothing true or false. But even those who, like Montaigne, deny certitude with respect to everything except matters of religious faith, do not go this far.

In his *Apology for Raimond de Sebonde* he concedes that if opinions are weighed as more or less probable, their truth or falsity is implied—at least as being the limit which an increasing probability or improbability approaches. Referring to ancient skeptics of the Academic school, he comments on the fact that they acknowledged "some things to be more likely than others"—as, for example, that snow is white rather than black. The more extreme skeptics, the Pyrrhonians, he points out, were bolder and also more consistent. They refused to incline toward one proposition more than toward another, for to do so, Montaigne declares, is to recognize "some more apparent truth in this than in that." How can men "suffer themselves," he asks, "to incline to and be swayed by probability, if they know not the truth itself? How should they know the similitude of that whereof they do not know the essence?"

In this respect Montaigne's own skepticism tends to be of the more moderate variety, since, in the realm of action at least, he would admit the need for judgments of probability. But in all other respects, he takes a firm skeptical stand that nothing is self-evident, nothing has been proved. The contradictory of everything has been asserted or argued by someone. "Men can have no principles," he writes, "if not revealed to them by the Divinity; of all the rest, the beginning, the middle, and the end are nothing but dream and vapor. . . . Every human presupposition and every declaration has as much authority, one as another. . . . The persuasion of certainty is a certain testimony of folly and extreme uncertainty."

The skeptical extreme is represented in the great books only through references to it for the purpose of refutation. Aristotle in the *Metaphysics*, for example, reports the position of those who say that all propositions are true or that all propositions are false, and who therefore deny the principle of contradiction and with it the distinction between true and false. But if all propositions are true, then the proposition "Some propositions are false" is also true; if

all propositions are false, the proposition "All propositions are false" is also false. The skeptic may reply, of course, that he is not checked by arguments which try to make him contradict himself, for he does not mind contradicting himself. To this there is only one answer, which is not to argue with the skeptic any further.

From the skeptic's point of view his position is irrefutable so long as he does not allow himself to accept any of the standards by which refutation can be effected. From his opponent's point of view complete skepticism is self-refuting because if the skeptic says anything definite at all, he appears to have some knowledge or at least to hold one opinion in preference to another. His only choice is to remain silent. If he insists upon making statements in defiance of self-contradiction, his opponent can do nothing but walk away.

"It may seem a very extravagant attempt of the skeptics to destroy *reason* by argument and ratiocination," Hume writes, "yet this is the grand scope of all their enquiries and disputes." He has in mind the excessive skepticism, or *Pyrrhonism*, from which he tries to distinguish a mitigated and beneficial form of skepticism. Referring to Berkeley's arguments against the independent reality of matter or bodies, Hume says their effect is skeptical, despite Berkeley's professed intention to the contrary. That his arguments are skeptical "appears from this, *that they admit of no answer and produce no conviction*. Their only effect is to cause that momentary amazement and irresolution and confusion, which is the result of skepticism."

Here and elsewhere, as in his comment on Descartes' skeptical method of doubting everything which can be doubted, Hume does not seem to think that excessive skepticism is refutable or even false. But it is impractical. "The great subverter of *Pyrrhonism* or the excessive principles of skepticism," he says, "is action, and employment, and the occupations of life." Extreme skepticism becomes untenable in thought the moment thought must face the choices of life and take some responsibility for action.

There is, however, "a more *mitigated* skepticism or *academical* philosophy which may be both durable and useful." This, according to Hume, consists in becoming "sensible of the

strange infirmities of human understanding," and consequently in "the limitation of our enquiries to such subjects as are best adapted to the narrow capacity of human understanding."

His own view of the extent and certainty of human knowledge seems to him to exemplify such mitigated skepticism in operation. The only objects with respect to which demonstration is possible are quantity and number. Mathematics has the certitude of knowledge, but it deals only with relations between ideas, not with what Hume calls "matters of fact and existence." Such matters "are evidently incapable of demonstration." This is the sphere of "moral certainty," which is not a genuine certainty, but only a degree of probability *sufficient for action*. Probabilities are the best that experimental reasoning or inquiry about matters of fact can achieve. If probability is characteristic of opinion rather than knowledge, then we can have nothing better than opinion concerning real existences.

THE DIAMETRICAL opposite to the extreme of skepticism would have to be a dogmatism which placed no objects beyond the reach of human knowledge, which made no distinction between degrees of knowability and admitted equal certitude in all matters. Like excessive skepticism this extreme is not a position actually held in the great books. All the great thinkers who have considered the problem of human knowledge have set limits to man's capacity for knowledge. They have placed certain objects beyond man's power to apprehend at all, or have distinguished between those which he can apprehend in some inadequate fashion, but cannot comprehend. They have indicated other objects concerning which his grasp is adequate and certain.

They all adopt a "mitigated skepticism"—to use Hume's phrase—if this can be taken to mean avoiding the extremes of saying that nothing is knowable at all and that everything is equally knowable. But they differ in the criteria they employ to set the limits of knowledge and to distinguish between the areas of certainty and probability. Consequently they differ in their determination of the knowability of certain types of objects, such as God or the infinite, substance or cause, matter or spirit, the real or the ideal, the self or the thing in itself.

For example, Plato and Aristotle agree that knowledge must be separated from opinion and even appeal to certain common principles in making that separation; but they do not define the scope of knowledge in the same way, as is indicated by their disagreement about the knowability of sensible things. Nor do Descartes and Locke, Bacon and Spinoza, Hume and Kant agree about the knowability of God or of the soul or about the conditions any object must meet in order to be knowable. All alike proceed from a desire to be critical. Each criticizes what other men have proposed as knowledge and each proposes a new method by which the pursuit of knowledge will be safeguarded from illusory hopes or endless controversy.

In this last respect the moderns depart most radically from their mediaeval and ancient predecessors. At all times men have been interested in examining knowledge itself as well as in exercising their powers to know. But in the earlier phase of the tradition knowledge about knowledge does not seem to take precedence over all other inquiries or to be prerequisite to them. On the contrary, the ancients proceed as if the study of knowledge necessarily presupposed the existence of knowledge. With them the examination takes place because the mind is essentially reflexive rather than for reasons of self-criticism. But beginning with Descartes' *Discourse on the Method*, in which a method of universal doubt is proposed to clear the ground before the foundations of the sciences can be laid, the consideration of knowing is put before any attempt to know.

Sometimes, as with Descartes and Bacon, the emphasis is upon a new method which will at last establish knowledge on a firm footing or advance learning. Sometimes, as with Locke and Hume, attention is given first of all to the faculty of understanding itself.

"If we can find out," says Locke, "how far the understanding can extend its views, how far it has faculties to attain certainty, and in what cases it can only judge and guess, we may learn to content ourselves with what is attainable by us in this state. . . . When we know our own strength, we shall the better know what to undertake with hopes of success; and when we have well surveyed the powers of our own minds, and made some estimate of what we may expect

from them, we shall not be inclined either to sit still, and not set our thoughts to work at all, in despair of knowing anything; nor, on the other side, question everything, and disclaim all knowledge, because some things are not to be understood."

Hume also proposes that a study of human understanding precede everything else, to "show from an exact analysis of its powers and capacity" what subjects it is or is not fitted to investigate. "There is a truth and falsehood in all propositions on this subject which lie not beyond the compass of human understanding." No one can doubt that a science of the mind—or knowledge about knowing—is possible unless he entertains "such a skepticism as is entirely subversive of all speculations, and even action."

Disagreeing with the principles of Locke and Hume, as well as with their conclusions, Kant does approve the priority they give to the question of the possibility of knowing certain objects. To proceed otherwise, as Kant charges most other philosophers with doing, is dogmatism. The use of the word "critique" in the title of Kant's three major works signifies his intention to construct a critical philosophy which does not presume that "it is possible to achieve anything in metaphysics without a previous criticism of pure reason." He does not object to what he calls "the dogmatical procedure of reason" in the development of science, but only after reason's self-criticism has determined just how far reason can go. For Kant, as for Bacon, dogmatism and skepticism are the opposite excesses which only a critical method can avoid.

THESE two different approaches to the theory of knowledge seem to result in different conclusions concerning the nature and scope of human knowledge. Those who begin with the established sciences and merely inquire into their foundations and methods, appear to end with unqualified confidence in man's ability to know. Those who make the inquiry into the foundations and methods of science a necessary preparation for the development of the sciences, tend for the most part to set narrower boundaries to the area of valid knowledge. The two approaches also affect the way in which the various kinds of knowledge are distinguished and compared.

There are two sorts of comparison involved

in the classification of kinds of knowledge. One is a comparison of human knowledge with divine, or with angelic knowledge and the knowledge of brute animals. The other is a comparison of the parts or modes of human knowledge according to such criteria as the objects to be known, the faculties engaged in the process of knowing, and the manner of their operation. Though made separately, those two comparisons are seldom independent of one another. As the nature of man is conceived in relation to other beings, superior or inferior to himself, his faculties will be rated accordingly, and his power as a knower will suggest the methods or means available to him for knowing.

Aquinas, for example, attributes to man the kind of knowledge appropriate to his station in the hierarchy of beings. Man is superior to the brutes because he has a faculty of reason in addition to the faculties of sense and imagination which he shares with them. Man is inferior to purely spiritual beings—the angels and God—because, since he is corporeal, his intellect cannot function independently of his bodily senses and imagination. Unlike the angels and God, he is not a purely intellectual being.

Accordingly, the essential characteristics of human knowledge are, first, that it is always both sensitive and intellectual, never merely sense-perception as with the brutes or pure intellectual intuition as with the angels; second, that its appropriate object is the physical world of sensible, material things, with respect to which the senses enable man to know the existence of individuals, while the intellect apprehends their universal natures; and, finally, that the way in which the human mind knows the natures of things is abstractive and discursive, for the intellect draws its concepts from sense and imagination and proceeds therefrom by means of judgment and reasoning.

This analysis denies innate ideas. It denies man's power to apprehend ideas intuitively or to use them intuitively in the apprehension of things. It can find no place for a distinction between *a priori* and *a posteriori* knowledge, since sense-perception and rational activity contribute elements to every act of knowing. It affirms that knowledge is primarily of real existence, not of the relations between ideas; but it does not limit human knowledge to the changing

temporal things of the material universe. Though these are the objects man is able to know with greatest adequacy, he can also know something of the existence and nature of immaterial and eternal beings.

Yet, according to Aquinas, even when man's knowledge rises above the realm of experienceable things, it is obtained by the same natural processes and involves the cooperation of the senses with reason. The theologian does, however, distinguish sharply between knowledge gained through man's own efforts and knowledge received through divine revelation. In addition to all knowledge acquired by the natural exercise of his faculties, man may be elevated by the supernatural gift of knowledge—the wisdom of a faith surpassing reason.

The foregoing summary illustrates, in the case of one great doctrine, the connection between an analysis of the kinds of knowledge and a theory of the nature and faculties of man in relation to all other things. There is no point in this analysis which is not disputed by someone—by Plato or Augustine, Descartes, Spinoza, or Locke, by Hume, Kant, or William James. There are many points on which others agree—not only Aristotle and Bacon, but even Augustine, Descartes, and Locke.

These agreements or disagreements about the kinds of knowledge, or the scope of human knowledge, its faculties, and its methods, seldom occur or are intelligible except in the wider context of agreements and disagreements in theology and metaphysics, psychology and logic. Hence most of the matters considered under the heading "kinds of knowledge" receive special consideration in other chapters. The Cross-References should enable the reader to examine the presuppositions or context of the materials assembled here.

THE CULT OF IGNORANCE receives little or no attention in the tradition of the great books. Even those who, like Rousseau, glorify the innocence of the primitives, or who satirize the folly so often admixed with human wisdom and the foibles attending the advance of learning, do not seriously question the ancient saying that all men by nature desire to know. Nor is it generally doubted that knowledge is good; that its possession contributes to the happiness of men

and the welfare of the state; that its pursuit by the individual and its dissemination in a society should be facilitated by education, by the support and freedom of scholars and scientists, and by every device which can assist men in communicating what they know to one another.

But knowledge is not valued by all for the same reason. That knowledge is useful to the productive artist, to the statesman, to the legislator, and to the individual in the conduct of his life, seems to be assumed in discussions of the applications of science in the various arts, in the consideration of statecraft, and in the analysis of virtue. In this last connection, the problem is not whether knowledge is morally useful, but whether knowledge of good and evil is identical with virtue so that sin and vice result from error or ignorance.

If there is a negative opinion here, it consists in saying that knowledge is not enough. To know is not to do. Something more than knowledge is required for acting well.

The more radical dispute about the value of knowledge concerns the goodness of knowledge for its own sake, without any regard to its technical or moral utility. Is the contemplation of the truth an ultimate end, or does the goodness of knowledge always consist in its power to effect results in the mastery of nature and the guidance of conduct? The utility of knowledge is seldom denied by those who make speculative wisdom and theoretic science good in themselves, even the highest goods, quite apart from any use to which they may be put. The con-

trary position, however, does not admit the special value of contemplation or the separation of truth from utility. To those who say that "the contemplation of truth is more dignified and exalted than any utility or extent of effects," Francis Bacon replies that "truth and utility are perfectly identical, and the effects are more of value as pledges of truth than from the benefit they confer on men."

How knowledge and action are related is one question; how knowledge itself is divided into the speculative and practical is quite another. Bacon, for example, insists upon the necessity of distinguishing the speculative and practical branches of natural philosophy—concerned with "the search after causes and the production of effects." Unlike Aristotle and Kant he does not use the word "practical" for the kind of knowledge which is contained in such sciences as ethics or politics, but only for the applied sciences or technology. Ethics and politics fall under what he calls "civil philosophy."

Despite these differences in language, the way in which Bacon divides the whole sphere of knowledge closely resembles Aristotle's tripartite classification of the sciences as theoretic, productive (or technical), and practical (or moral); and, no less, a similar threefold division by Kant. But Kant and Aristotle (and, it should be added, Aquinas) give a more elaborate analysis of these three types of knowledge, especially with regard to the principles appropriate to each, the nature of the judgments and reasoning by which they are developed, and the character and criteria of their truth.

OUTLINE OF TOPICS

	PAGE
1. The nature of knowledge: the relation between knower and known; the issue concerning the representative or intentional character of knowledge	890
2. Man's natural desire and power to know	891
3. Principles of knowledge	892
4. Knowledge in relation to other states of mind	
4a. Knowledge and truth: the differentiation of knowledge, error, and ignorance	
4b. Knowledge, belief, and opinion: their relation or distinction	893
4c. The distinction between knowledge and fancy or imagination	894
4d. Knowledge and love	

	PAGE
5. The extent or limits of human knowledge	895
5a. The knowable, the unknowable, and the unknown: the knowability of certain objects	
(1) God as an object of knowledge	
(2) Matter and the immaterial as objects of knowledge	896
(3) Cause and substance as objects of knowledge	897
(4) The infinite and the individual as objects of knowledge	
(5) The past and the future as objects of knowledge	898
(6) The self and the thing in itself as objects of knowledge	
5b. The distinction between what is more knowable in itself and what is more knowable to us	899
5c. Dogmatism, skepticism, and the critical attitude with respect to the extent, certainty, and finality of human knowledge	
5d. The method of universal doubt as prerequisite to knowledge: God's goodness as the assurance of the veracity of our faculties	900
5e. Knowledge about knowledge as the source of criteria for evaluating claims to knowledge	
6. The kinds of knowledge	
6a. The classification of knowledge according to diversity of objects	
(1) Being and becoming, the intelligible and the sensible, the necessary and the contingent, the eternal and the temporal, the immaterial and the material as objects of knowledge	
(2) Knowledge of natures or kinds distinguished from knowledge of individuals	901
(3) Knowledge of matters of fact or real existence distinguished from knowledge of our ideas or of the relations between them	902
(4) Knowledge in relation to the distinction between the phenomenal and the noumenal, the sensible and supra-sensible	
6b. The classification of knowledge according to the faculties involved in knowing	
(1) Sensitive knowledge: sense-perception as knowledge; judgments of perception and judgments of experience	
(2) Memory as knowledge	903
(3) Rational or intellectual knowledge	904
(4) Knowledge in relation to the faculties of understanding, judgment, and reason; and to the work of intuition, imagination, and understanding	
6c. The classification of knowledge according to the methods or means of knowing	
(1) Vision, contemplation, or intuitive knowledge distinguished from discursive knowledge	
(2) The distinction between immediate and mediated judgments: induction and reasoning, principles and conclusions	905
(3) The doctrine of knowledge as reminiscence: the distinction between innate and acquired knowledge	
(4) The distinction between <i>a priori</i> and <i>a posteriori</i> knowledge: the transcendental, or speculative, and the empirical	906
(5) The distinction between natural and supernatural knowledge: knowledge based on sense or reason distinguished from knowledge by faith or through grace and inspiration	

6d. The classification of knowledge according to the degrees of assent	907
(1) The distinction between certain and probable knowledge	
(2) The types of certainty and the degrees of probability	908
(3) The distinction between adequate and inadequate, or perfect and imperfect knowledge	
6e. The classification of knowledge according to the end or aim of the knowing	
(1) The distinction between theoretic and practical knowledge: knowing for the sake of knowledge and for the sake of action or production	
(2) The types of practical knowledge: the use of knowledge in production and in the direction of conduct; technical and moral knowledge	909
7. Comparison of human with other kinds of knowledge	
7a. Human and divine knowledge	
7b. Human and angelic knowledge	910
7c. Knowledge in this life compared with knowledge in the state of innocence and knowledge hereafter	
7d. The knowledge of men and brutes	911
8. The use and value of knowledge	
8a. The technical use of knowledge in the sphere of production: the applications of science in art	
8b. The moral use of knowledge and the moral value of knowledge	912
(1) The knowledge of good and evil: the relation of knowledge to virtue and sin	
(2) Knowledge as a condition of voluntariness in conduct	913
(3) Knowledge in relation to prudence and continence	914
(4) The possession or pursuit of knowledge as a good or satisfaction: its relation to pleasure and pain; its contribution to happiness	
8c. The political use of knowledge: the knowledge requisite for the statesman, legislator, or citizen	915
9. The communication of knowledge	916
9a. The means and methods of communicating knowledge	
9b. The value of the dissemination of knowledge: freedom of discussion	917
10. The growth of human knowledge: the history of man's progress and failures in the pursuit of knowledge	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature of knowledge: the relation between knower and known; the issue concerning the representative or intentional character of knowledge

Chapter 44: LABOR

INTRODUCTION

MEN have dreamed of a golden age in the past when the world was young and everything needed for the support of life existed in profusion. Earth, Lucretius writes, "first spontaneously of herself produced for mortals goodly corn-crops and joyous vineyards; of herself gave sweet fruits and glad pastures; which now-a-days scarce attain any size even when furthered by our labor; we exhaust the oxen and the strength of the husbandmen; we wear out our iron, scarcely fed after all by the tilled fields; so niggardly are they of their produce and after so much labor do they let it grow." When the aged plowman "compares present times with times past," Lucretius adds, "he praises the fortunes of his sire" living in the time of earth's plenty.

This ancient myth of a golden age has sometimes taken the form, as with Rousseau, of an idealization of primitive society, uncorrupted by civilization, in which an easy, almost effortless, existence corresponded to the simplicity of man's needs. Rousseau pictures a situation in which "the produce of the earth furnished [man] with all he needed, and instinct told him how to use it," so that "singing and dancing, the true offspring of love and leisure, became the amusement, or rather the occupation of men and women assembled together with nothing else to do."

In our own day, industrial utopias have been projected into a future made free from toil by the adequacy of machines or the efficiency of atomic energy. Long before the industrial era, Aristotle envisioned, as a supposition contrary to fact, a society built upon labor-saving machines. "If every instrument could accomplish its own work," he writes, if it could obey or anticipate commands, if "the shuttle would weave . . . without a hand to guide it, the chief workmen would not want servants, nor masters slaves."

In all these conceptions of a better life, labor is eliminated or reduced. The implication seems to be that the labor required for the maintenance of all historic societies is an affliction, a drudgery, a crushing burden which deforms the lives of many, if not all. The pains of toil do not belong to human life by any necessity of human nature, but rather through the accident of external circumstances which might be other than they are. "Work became indispensable," according to Rousseau, only when "property was introduced," and then "vast forests became smiling fields, which man had to water with the sweat of his brow." It was the result of "some fatal accident, which, for the public good, should never have happened." Man might have realized his nature more surely and richly if, like the lilies of the field, he neither toiled nor spun.

The contrary view would maintain that work is not a curse but a blessing, filling man's hours usefully, turning to service energies which would otherwise be wasted or misspent in idleness or mischief. The sinfulness of sloth implies the virtue of work. The principle of activity, according to Hegel, whereby "the workman has to perform for his subsistence," gives man a dignity which "consists in his depending entirely on his diligence, conduct, and intelligence for the supply of his wants. In direct contravention of this principle" are "pauperism, laziness, inactivity."

It is even suggested that useful occupations save men from a boredom they fear more than the pain of labor, as evidenced by the variety of amusements and diversions they invent or frantically pursue to occupy themselves when work is finished. The satisfactions of labor are as peculiarly human as its burdens. Not merely to keep alive, but to keep his self-respect, man is obliged to work.

"In the morning when thou risest unwilling," the emperor Marcus Aurelius tells himself, "let this thought be present—I am rising to the work of a human being. Why, then, am I dissatisfied if I am going to do the things for which I exist and for which I was brought into the world? Or have I been made for this, to lie in the bed-clothes and keep myself warm? But this is more pleasant. Dost thou exist, then, to take thy pleasure, and not at all for action and exertion?"

The perspectives of theology give still another view of labor. It is not an accidental misfortune which men may some day be able to correct. But neither is it a blessing nor the thing for which man was created. When the golden age of Saturn came to an end, and Jupiter replaced him on the throne of heaven, then, as Virgil tells the story, labor was first introduced into the world. "Before Jove

Fields knew no taming hand of husbandmen;
To mark the plain or mete with boundary-line—
Even this was impious; for the common stock
They gathered, and the earth of her own will
All things more freely, no man bidding, bore.
He to black serpents gave their venom-bane,
And bade the wolf go prowling, and ocean toss;
Shook from the leaves their honey, put fire away,
And curved the random rivers running wine,
That use by gradual dint of thought on thought
Might forge the various arts, with furrow's help
The corn-blade win, and strike out hidden fire
From the flint's heart.

Here, while labor may in some sense be a punishment, or at least a fall from the golden age, it still does result in benefits. "The divers arts arose" from Jove's "whetting the minds of men with care on care, nor suffering realm of his in drowsy sloth to stagnate." But although "toil conquered all," it is still "remorseless toil."

According to Christian doctrine, labor is an inevitable consequence of man's fall from grace, a punishment for Adam's disobedience like disease and death. In the earthly paradise of Eden, the children of Adam would have lived without labor or servitude of any sort. But when Adam sinned, the Lord God said unto him: "Cursed is the ground for thy sake; in toil shalt thou eat of it all the days of thy life . . . In the sweat of thy face, shalt thou eat bread, till thou return into the ground."

That work should be painful belongs to its

very essence. Otherwise it would not serve as a penalty or a penance. But, in the Christian as in the Virgilian view, labor also contributes to such happiness as man can enjoy on earth. The distinction between temporal and eternal happiness is a distinction between a life of work on earth and the activity of contemplation in Heaven. This does not mean the elimination of leisure and enjoyment from earthly life, but it does make labor their antecedent and indispensable condition. It also means that even in his highest activities—in the development of his arts and sciences—man must be perpetually at work. His achievement of truth or beauty is never so perfect and lasting that he can rest in it.

IN THESE DIVERSE conceptions of the relation of labor to human life, work seems to have several different meanings. It always involves activity or exertion. Its clearest opposite is sleep. But other things are also opposed to work—play or amusement, leisure, idleness. When leisure is not identified with idleness, it involves activity no less than work. So, too, many of the forms of play require intense exertion of body or mind. The difference, therefore, must lie in the nature or purpose of the activity.

Aristotle suggests what the difference is when he puts play, work, and leisure in an ordered relationship to one another. Nature, he writes, "requires that we should be able, not only to work well, but to use leisure well." Leisure is "the first principle of all action" and so "leisure is better than work and is its end." As play and with it rest (*i.e.*, sleep) are for the sake of work, so work in turn is for the sake of leisure.

The characteristics of work as the middle term here seem to be, first, that work is activity directed to an end beyond itself and, second, that it is productive of the necessities which sustain life rather than of the goods by which life is perfected. The political or speculative activity which Aristotle considers the proper occupation of leisure is intrinsically good or enjoyable. For participation in such activities leisure—in the sense of time free from labor—is required; but since the good life cannot be lived unless life itself is sustained, labor also is a prerequisite.

Work is thus defined by wealth as its immediate end—the production of the external, eco-

nomie, or consumable goods which support life. Though play has the immediately enjoyable character of an activity performed for its own sake, Aristotle subordinates it to work, assigning to it the same utility which rest has. Both refresh men from the fatigues of labor and recreate the energies needed for work. "Amusement," he writes, "is needed more amid serious occupations than at other times, for he who is hard at work has need for relaxation, and amusement gives relaxation."

The economic sense which connects work and labor with wealth seems to be the primary but not the only sense in which these terms are used in the great books. There is the more general sense of human work as any productive activity in which men exercise some art or skill. The familiar distinction between skilled and unskilled labor may be only a distinction in degree if there is truth in the theory that some degree of skill—some rudimentary art at least—is required for the performance of the simplest tasks of hand and eye.

Kinds of work, according to this theory, can be differentiated by reference to the type of art involved. The ancient distinction between the servile and the liberal arts also divides workers into those who manipulate and transform physical materials and those who employ the symbols of poetry, music, or science to produce things for the mind. This distinction between manual and mental work, based on the character of the work itself, is not to be identified with the distinction between slave and free labor. The latter is based on the status of the worker. Even in the slave economies of the ancient world, some freemen were artisans, farmers, or sailors, and some slaves were philosophers. Nor is mental as opposed to manual work necessarily directed to the production of the goods of the mind. The white-collar workers of an industrial economy, employed with the symbols of finance, accounting, or management, do mental work which has its ultimate end in the production or exchange of material goods.

THERE ARE STILL other traditional distinctions among kinds of work and types of workers, all of which cannot be put together into a single scheme of classification without much overlapping. Some distinctions, like that between

hand-work and machine-labor or between healthful and unhealthful occupations, turn on the characteristics of the work itself. Some depend on the social conditions under which the work is done or on the relationship between the individual worker and other men. The work to be done may be accomplished by an individual working alone, or by the cooperative labor of many; and, in the latter case, the social organization of the laboring group may involve the ranking of men according to the functions they perform.

Here we get the division into the master-craftsmen, who plan and superintend, and all grades of helpers who execute their directions. One meaning of the word "menial" as applied to work signifies the inferior tasks in the hierarchy of functions; but it is also used to express society's opinion of those who perform certain tasks, such as that of the domestic servant. The distinction between what is menial and what is dignified work varies, of course, from society to society.

The characterization of labor as productive or non-productive, and of work as useful or wasteful, is based on strictly economic criteria and on considerations of social welfare. The sense in which work cannot be divorced from the production of some extrinsic effect is not violated by the conception of non-productive labor as work which in no way increases the wealth of nations.

"There is one sort of labor which adds to the subject upon which it is bestowed; there is another which has no such effect. The former," writes Adam Smith, "may be called productive; the latter, unproductive labor . . . The labor of some of the most respectable orders in society is . . . unproductive of any value . . . The sovereign, for example, with all the officers both of justice and war who serve under him, the whole army and navy, are unproductive laborers . . . Like the declamation of the actor, the harangue of the orator, or the tune of the musician, the work of all of them perishes in the very instant of its production."

The standard by which Marx judges the usefulness of labor also implies the economic notion of a commodity. "Nothing can have value," he says, "without being an object of utility. If the thing is useless, so is the labor contained in

it." But Marx also adds a criterion of social utility. "Whoever directly satisfies his own wants with the produce of his labor, creates, indeed, use-values, but not commodities. In order to produce the latter, he must not only produce use-values, but use-values for others, social use-values." It is by this last criterion that Marx criticizes the capitalist economy for its "most outrageous squandering of labor power" in superfluous or socially useless production.

THE PRINCIPLE OF the division of labor does not depend upon any particular classification of work or workers according to type. Nor does it belong to one system of economy rather than another. But the ancients, concerned as they were with its bearing on the origin and development of the state, saw the division of labor as primarily of political significance; whereas the moderns are more concerned with its economic causes and consequences.

Thucydides compares the poverty and crude life of the early Hellenic tribes with the wealth, the power, and the civilization of Athens, Sparta, Corinth, and other city-states at the opening of the Peloponnesian War. The difference is not to be accounted for in terms of the invention of new tools, but rather in terms of the greater efficiency in production which is obtained by a division of labor. This is both an effect and a cause of the enlargement of the community, and its increasing population. The greater the number of men associated in a common life, the greater the number of specialized tasks which can be assigned to different members of the community.

This observation is formulated by Plato and Aristotle in their accounts of the origin of the state. The advantages which the state confers upon its members are in part won by the division of labor in which they participate.

The isolated family, Aristotle remarks, is barely able to supply the "everyday wants" of its members. The tribe or village, which is an association of families, can achieve a little more than bare subsistence; but not until several tribes unite to form a city does a truly self-sufficing community come into existence, and one with an adequate division of labor. Some men, if not all, can then acquire the leisure to engage in the arts and sciences and politics—the

pursuits of civilization which have their material basis in sufficient wealth.

The effect of the division of labor on the social structure of the state seems to be generally agreed upon by all observers, ancient and modern. Men are divided into social classes according to the kind of work they do—not only by reference to the type of economically productive labor, but also in terms of the distinction between labor and leisure, or between economic and other functions in society.

All do not agree, however, that such class distinctions are as beneficial to society as the increase of wealth or opulence which the division of labor affords. They not only threaten the unity and peace of the society, but tend to degrade the condition of labor by reducing the individual worker to a cog in the machine. The division of labor frequently restricts him to a slight and insignificant task, repetitively performed, and so makes it impossible for him to develop his skill or to enjoy any pride of workmanship. From a purely economic point of view, Adam Smith advocates the greatest intensification of the division of labor. Each more minute sub-division of tasks augments efficiency in production. But from the human point of view, he sees that this method of maximizing wealth by dividing men into functional groups—one man, one task—leads to the mental impoverishment of the men, who require a multiplicity of functions for their development.

"In the progress of the division of labor," Smith writes, "the employment of the far greater part of those who live by labor . . . comes to be confined to a few very simple operations, frequently one or two . . . The man whose whole life is spent in performing a few simple operations . . . has no occasion to exert his understanding or to exercise his invention . . . He naturally loses, therefore, the habit of such exertion, and generally becomes as stupid and ignorant as it is possible for a human creature to become." The situation seems even worse to Marx. The industrial system, revolutionizing the mode of work, "converts the laborer into a crippled monstrosity, by forcing his detailed dexterity at the expense of a world of productive capabilities and instincts." It makes the individual worker "the automatic motor of a fractional operation."

THE GREAT ISSUES concerning labor seem to be moral and political rather than economic. The consideration of the division of labor from the point of view of efficiency in production remains purely economic only when it is abstracted from any concern about the effect upon the laborer. The analysis of factors affecting the productivity of labor ceases to be merely economic when the hours, conditions, and organization of work are viewed in terms of the working men.

The determination of wages by the buying and selling of labor (or, as Marx insists, of labor-power) as a commodity subject to market conditions of supply and demand; the difference between real and nominal wages as determined by the level of wages in relation to the price of other commodities; the so-called "iron law of wages" according to which wages cannot be reduced below the minimum of bare subsistence for the laborer and his family—these are matters which the economist may deal with in a descriptive or historical manner, calculating rates and ratios without regard to questions of justice. But in terms of such formulations questions of justice are raised and become the great issues concerning the rights of workmen to the fruits of their labor, to the security of full employment and other forms of protection, to collective bargaining, to a voice in the management of industry or business.

Stated in this way, the issues seem to be peculiarly modern. These are the problems of a capitalist economy, to which the partisans of capital and of labor propose different solutions. Yet the principles of justice to which the parties in conflict appeal seem to be no less applicable to earlier conflicts in other economic systems—between master and slave or between feudal lord and serf. All the institutional differences among these three economies should not, according to Karl Marx, conceal from us the profound analogy which obtains in the relation between owners and workers, whether the workers are chattel slaves, peons bound to the land, or industrial proletarians selling their labor-power.

"Wherever a part of society possesses a monopoly of the means of production," he writes, "the laborer, free or not free, must add to the working time necessary for his own mainte-

nance an extra working time in order to produce the means of subsistence for the owners of the means of production, whether this proprietor be the Athenian gentleman, Etruscan theorat, civis Romanus, Norman baron, American slave-owner, Wallachian Boyard, modern landlord or capitalist."

Marx undertakes to explain how the surface difference between slave labor and wage labor conceals the analogy. "In slave labor, even that part of the working-day in which the slave is only replacing the value of his own means of existence, in which, therefore, he works for himself alone, appears as labor for his master. All the slave's labor appears as unpaid labor. In wage-labor, on the contrary, even surplus labor, or unpaid labor, appears as paid. There the property-relation conceals the labor of the slave for himself; here the money-relation conceals the unrequited labor of the wage laborer."

Two phrases here—"unpaid labor" and "unrequited labor"—indicate that Marx is thinking in terms of justice. Elsewhere he calls the industrial proletariat "wage-slaves" to emphasize the presence in an apparently free economy of the same unjust exploitation which the word "slave" connotes when it refers to the use of men as chattel. The essential similarity in all forms of economic exploitation—which makes all forms of economic slavery essentially similar—is seen by Marx in terms of the production of a surplus value by the laborer; that is, he produces a greater value in commodities than he needs to support his own subsistence. This surplus value, when appropriated by the owner of the materials and the tools on and with which the propertyless laborer works, becomes an unearned increment, or, in other words, an unjust profit from the work of another man.

The controversy over the theory of surplus value in Marx's *Capital* can be separated from the controversy over the revolutionary program of the *Communist Manifesto*. But neither can be separated from issues of justice. It is questionable whether those economists join issue with Marx who criticize his analysis in terms of the facts or conclusions of economics as a purely descriptive science, and who put aside all considerations of the fair and the equitable. Yet those facts or conclusions, especially with regard to the operation of the capitalist economy,

become relevant in the dispute as to whether capitalist profits are intrinsically unjust, because they are incapable of accruing except from the exploitation of labor.

Those who dispute this matter seldom deny that chattel slavery is unjust. On that there may be conflicting opinions, as indicated in the chapter on SLAVERY, but they are not germane to the present issue. Nor do the opponents seem to argue their case in terms of a different theory of what is just and unjust. They themselves appeal to the common principle of fairness in exchange and distribution to defend the rights of the owners of capital to a profit in return for their own prior labor in accumulating capital stock, as well as for the risks they take when they invest their reserves in productive enterprises. The problem, therefore, seems to narrow down to such questions as whether laborers are exploited when they receive in wages less than the full value their work creates; whether capitalist profits are entirely reaped from the surplus value which is the differential between what labor creates and what labor receives; or whether, if profit is not identical with surplus value, it always contains a marginal element of unearned increment derived from the exploitation of labor.

THE NOTION OF VALUE—the value of commodities and the value of labor itself—is obviously of central importance. As indicated in the chapter on JUSTICE, the formulae of equality, which determine fair exchanges or distributions, require some measure of equivalents in value. What determines the intrinsic value of a commodity according to which it can be compared with another commodity, without reference to the price of each in the market place? Adam Smith's answer to this question is *labor*. It is the answer given before him by Locke, and after him by Marx.

"Equal quantities of labor, at all times and places," Smith declares, "may be said to be of equal value to the laborer. In his ordinary state of health, strength and spirits; in the ordinary degree of his skill and dexterity, he must always lay down the same portion of his ease, his liberty, and his happiness. The price which he pays must always be the same, whatever may be the quantity of goods which he receives in

return for it. Of these, indeed, it may sometimes purchase a greater and sometimes a smaller quantity; but it is their value which varies, not that of the labor which purchases them." From this Adam Smith concludes that "labor alone, therefore, never varying in its own value, is alone the ultimate and real standard by which the value of all commodities can at all times and places be estimated and compared. It is their real price; money is their nominal price only."

This labor theory of value raises the further question of the value of labor itself. What determines its natural or real price, as opposed to its market or nominal price? On this Marx and Smith appear to part company, which may account for their further divergence when Marx declares that "the real value of labor is the cost of its production, not the average price it can command in the market"; and then goes on to explain how a surplus value is derived by the capitalist who pays for labor-power on a basis of the cost of producing and sustaining the laborer, but uses his labor-power to produce a real value in commodities which exceeds the real price of labor itself.

Smith, on the other hand, holds that "the whole produce of labor belongs to the laborer" only "in that original state of things, which precedes both the appropriation of land and the accumulation of stock." When "land becomes private property," the landlord "makes the first deduction" in the form of *rent*; and the capitalist, or the person who invests some part of his stock accumulation, "makes a second deduction" in the form of *profit*. After rent and profit are taken, the laborer's *wage* represents what is left of "the whole produce of labor."

Yet Smith also says of the landlords that "as soon as the land of any country has all become private property," they, "like all other men, love to reap where they never sowed." The implication of unearned increment in this remark suggests that Smith is neither disinclined to mix moral judgment with economic description, nor at variance with Marx on the principle of economic justice. That Smith regards profit as the price properly paid for the use of capital and that he does not see reaping without sowing as an essential element in profit-making may perhaps be read as a challenge to Marx's develop-

ment of the labor theory of value into a theory of surplus value and unearned increment.

IT IS POSSIBLE, of course, that the difference in the conclusions of Smith and Marx from a common premise can be explained by the different directions their analyses take. It may not represent a direct opposition on a point of fact. The proposition that value derives from labor seems to yield a number of theoretical consequences.

Locke, for example, holding that it is labor which "puts the difference of value on everything," makes this the basis for the right to private property, certainly in its original appropriation from the common domain which is God's gift to mankind. "Though the earth and all inferior creatures be common to all men, yet every man has a property in his own person. The labor of his body and the work of his hands we may say are properly his. Whatsoever, then, he removes out of the state that nature hath provided and left it in, he hath mixed his labor with, and joined to it something that is his own, and thereby makes it his property."

This view seems to be shared by Rousseau. "It is impossible to conceive," he says, "how property can come from anything but manual labor; for what else can a man add to things which he does not originally create, so as to make them his own property?" In the same vein, Smith declares that "the property which every man has in his own labor, as it is the original foundation of all other property, so it is the most sacred and inviolable."

What further conclusions follow from this justification of private property as a right founded upon labor? How is the original right to property extended into a right of inheritance? How does this conception of the origin of property bear on the Marxist conception of the origin of the proletariat—the propertyless workers who have nothing but their labor-power to sell? Denying the charge that communists desire to abolish "the right of personally acquiring property as the fruit of a man's own labor," Marx and Engels make the countercharge that the development of industrial capitalism "has to a great extent already destroyed it and is still destroying it daily." They propose public ownership of the means of production to protect the property rights of labor;

they seek to abolish only "the bourgeois form of private property" which, in their view, is a use of property to exploit labor.

The rights of labor seem to be central in any formulation of the problem of a just distribution of wealth. But when other rights are taken into consideration, the problem of economic justice becomes more complex; and different solutions result from differences in emphasis. Even with regard to one group of solutions, J. S. Mill observes that "some communists consider it unjust that the produce of the labor of the community should be shared on any other principle than that of exact equality; others think it just that those should receive most whose wants are greatest." To weigh the merits of competing solutions, as well as to reach an adequate statement of the problem, the discussion of labor must be connected with the discussion of related considerations in the chapters on JUSTICE, REVOLUTION, and WEALTH.

THERE ARE ISSUES of justice concerning labor other than the strictly economic problem of distribution. In the ancient world, for example, not only chattel slaves but also free artisans were frequently regarded as incapable of participation in political life. Only men of independent wealth had enough leisure for the activities of citizenship which, in the Greek city-states, was almost a full-time occupation. This, according to Aristotle, is one reason for the disfranchisement of the laboring classes who must devote a great part of their energy to earning a living and who have neither the time nor training for liberal pursuits. "Since leisure is necessary both for the development of virtue and the performance of political duties," citizens, he maintains, cannot "lead the life of mechanics or tradesmen."

Against this oligarchical view (which also involves the notion that wealth deserves special political privileges), the Greek democrats take the position that all free men should be citizens on an equal footing, regardless of the amount of their property or their conditions of labor and leisure. But the oligarchical principle still tends to prevail among republicans in the 18th century. Kant, for example, holds that citizenship "presupposes the independence or self-sufficiency of the individual citizen among the peo-

ple." On this basis he excludes from the suffrage, as only "passive" citizens, "the apprentice of a merchant or tradesman, a servant who is not in the employ of the state, a minor (*naturaliter vel civiliter*), all women, and, generally, everyone who is compelled to maintain himself not according to his own industry, but as it is arranged by others (the state excepted)." They are "without civil personality, and their existence is only, as it were, incidentally included in the state."

The preference shown by the writers of *The Federalist* for a republican as opposed to a democratic form of government—or representative government as opposed to direct democracy—rests partly on their fear of the political incompetence, as well as the factional interests, of wage earners and day-laborers. While expressing "disapprobation" of poll taxes, they still defend the right of the government to exact them, in the belief that "there may exist certain critical and tempestuous conjunctures of the State, in which a poll-tax may become an inestimable resource." Yet such a tax would seem to be primarily a device for disfranchising working-

men of no property and small income, and in the opinion of a later day it is so regarded.

The democratic revolution does not begin until the middle of the 19th century. But even then, Mill, who advocates universal suffrage, argues for the disqualification of paupers or those on the dole, without raising the question whether the right to work—to avoid poverty and involuntary indigence—is not a democratic right inseparable from the right to citizenship. It is "required by first principles," Mill writes, "that the receipt of parish relief should be a peremptory disqualification for the franchise. He who cannot by his labor suffice for his own support has no claim to the privilege of helping himself to the money of others. By becoming dependent on the remaining members of the community for actual subsistence, he abdicates his claim to equal rights with them in other respects."

The historic connection of democracy with a movement toward political justice for the laboring classes seems to suggest that political democracy must be accompanied by economic democracy in order to attain its full realization.

OUTLINE OF TOPICS

	PAGE
1. Labor in human life	930
1a. The curse of labor: myths of a golden age and the decay of the world	
1b. Labor, leisure, and happiness: the servile, political, and contemplative life	
1c. The pain of labor and the expiation of sin: the disciplinary and penal use of labor	931
1d. The social necessity of labor and the moral obligation to work	
1e. The honor of work and the virtue of productivity: progress through the invention of arts for the conquest of nature	932
1f. The degradation of labor: the alienation of the laborer's work in chattel slavery, serfdom, and industrial wage slavery	
2. The nature of work	
2a. The ends of work: the good of the product and the good of the workman	
2b. The process of work: the relations of art, hand, machine, and matter	933
3. The kinds of work and the relationship of different types of workers	
3a. The differentiation of work according to the human talent or ability required: skilled and unskilled labor; manual and mental work	
3b. The differentiation of work according to the social status of the worker: servile and free, menial and honorable work	

- 3c. The classification of occupations by reference to bodily and mental concomitants of the work: healthy and unhealthy occupations; pleasant and unpleasant tasks 933
- 3d. Types of work distinguished by reference to the manner in which the work is done: solitary and group work; the relation of master-craftsmen and helpers 934
- 3e. Types of work distinguished by reference to their effect on the increase of wealth: productive and non-productive labor
- 3f. The differentiation of work in terms of its relation to the common welfare: socially useful and wasteful or superfluous work
- 4. The division of labor
 - 4a. The economic causes and effects of the division of labor: its relation to the exchange, production, and distribution of goods and services; its bearing on opulence
 - 4b. The social consequences of the division of labor: the development of classes
 - 4c. The moral aspects of the division of labor: the acquisition of the virtue of art; the attenuation of art by insignificant tasks 935
- 5. The organization of production: the position of labor in different economies
 - 5a. Domestic or chattel slavery in a slave economy
 - 5b. Serfdom or agrarian peonage in a feudal economy
 - 5c. The wage earner or industrial proletariat in a capitalist economy 936
 - 5d. The condition of the worker in a socialist economy
- 6. The wages of labor: kinds of wage payments
 - 6a. Labor as a commodity: the labor market
 - 6b. The iron law of wages: the subsistence level and the minimum wage
 - 6c. The distinction between real and nominal wages: variable factors affecting wage levels
 - 6d. The natural wages of labor and the labor theory of value
- 7. Economic and political justice to the laborer
 - 7a. Fair wages, hours, and working conditions: labor legislation
 - 7b. The right to property: the ownership of the means of production 937
 - 7c. The consequences of economic inequality or oppression: the class war
 - (1) The economic determination of antagonistic social classes: slaves *vs.* free-men; laboring *vs.* leisure classes; propertyless *vs.* propertied classes
 - (2) The organization of workmen and the formation of trade unions to protect labor's rights and interests 938
 - (3) The proletariat as a revolutionary class: its revolutionary aims
 - 7d. The underprivileged condition of workers: the exclusion of slaves from citizenship; the disfranchisement of the laboring classes
 - 7e. The problem of poverty and pauperism: unemployment and the right to work
 - 7f. The relation of economic to political freedom: economic democracy
- 8. Historical observations on the condition of labor 939

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Labor in human life

1a. The curse of labor: myths of a golden age and the decay of the world

OLD TESTAMENT: *Genesis*, 3:17-19, 23 / *Psalms*, 90:10—(D) *Psalms*, 89:10 / *Ecclesiastes*, 1:3-2:11; 2:17-24; 3:9-13; 4:4-8; 5:15-16; 6:7—(D) *Ecclesiastes*, 1:3-2:11; 2:17-24; 3:9-13; 4:4-8; 5:14-16; 6:7 / *Jeremiah*, 20:18—(D) *Jeremias*, 20:18

Chapter 45: LANGUAGE

INTRODUCTION

THE liberal arts of grammar, rhetoric, and logic are all concerned with language. Each of these disciplines establishes its own rules for the use of language, each by reference to a special standard of excellence or correctness which measures language as an instrument of thought or communication. Together these three arts regulate discourse as a whole. Their relation to one another represents the relation of the various aspects of discourse—the emotional, the social, and the intellectual.

The tradition of the great books is the tradition of the liberal arts. Their greatness consists not only in the magnitude of the ideas or problems with which they deal, but also in their formal excellence as products of liberal art. Some of the great books are expositions of logic or rhetoric. None is a treatise on grammar. But they all plainly exemplify, even where they do not expound, the special refinements of the arts of language; and many of them, especially the works of science, philosophy, and theology, and even some of the poetical works, deal explicitly with the difficulties of discourse, and the devices that have been used to overcome them. Language is their instrument, and they are consciously critical in its use.

One of the great books—Augustine's treatise *On Christian Doctrine*—is directly and explicitly concerned with grammar in the broad sense of the art of reading. Addressed to "earnest students of the word," it attempts to "lay down rules for interpretation," and, in so doing, it is compared by Augustine to "one who teaches reading, that is, shows others how to read for themselves." It is not reading in general, however, but the reading of one book—the Bible—with which Augustine is concerned. We shall return later to this special problem of interpreting the word of God, or language which is thought to be inspired.

In our day, there is a lively interest in the problems of language. This is partly because of the development of historical and comparative studies of the various human languages, and the scientific formulation of what is common to all languages in origin, structure, and change. But it also results in part from the claims of a discipline popularly called "semantics" to have discovered the properties of language as a medium of expression, and especially to have discovered its limitations. The claims of semantics often go so far as to find in the misuse of language the origin of many human ills. The novelty of semantics is supposed to lie both in the diagnosis and in the remedies proposed.

Of these two sources of current interest in language, the second calls attention to the vitality of the liberal arts, of which semantics is a contemporary formulation. It might almost be said that there is nothing new about semantics except the name. Hobbes, Bacon, and Locke, for example, deal explicitly with the abuses of language and the treachery of words. Each makes recommendations for the correction of these faults. Plato and Aristotle, Augustine and Aquinas, Berkeley and Hume, are similarly concerned with ambiguity in speech, with the multiple senses in which discourse of every sort can be interpreted, and with the methods by which men can approximate precision in the use of language.

The other interest in language is also represented in the great books. Though the science of linguistics and the history of languages are researches of recent origin, speculation about the origin of language and, in that context, consideration of the natural and conventional aspects of language extend throughout the tradition. At all times the discussion of the nature of man and society considers language as one of the principal characteristics of the specifically

human world or compares the language of men with the speech of brutes.

In addition there is the broad philosophical inquiry into the nature of signs and symbols in general. This is not limited to the problem of how written or spoken words get their meaning. The general question calls for an examination of every type of signifying and every sort of symbol, verbal and non-verbal, natural and artificial, human and divine. Though these matters are closely related to the problems of language and may therefore be touched upon here, their main treatment is reserved for the chapter on SIGN AND SYMBOL.

THE TREATMENT of language seems to have a different tenor in ancient and modern times. The philosophers of antiquity appreciate the need to safeguard discourse from the aberrations of speech. Plato and Aristotle usually preface their discussion of a subject with an examination of the relevant words in current use. Discovering the variety of meanings attached to common words, they take pains to enumerate the various senses of a word, and to put these meanings in some order. They pursue definitions or construct them to control the ambiguity that is latent in the language anyone must use to express or communicate ideas. But they do not expect to remove ambiguity entirely. They tend to accept the fact that the same word will have to be used in a number of senses; and they discriminate between the occasions when it is desirable to be precise about a word's meaning and those times when the purpose of discourse is better served by permitting a word to carry a whole range of meanings. They see no special difficulty in abstract as opposed to concrete words, or in general names as distinguished from the proper names which designate individuals, or in words which refer to purely intelligible objects like ideas rather than to the objects of sense-experience.

The mood of the ancients, which also prevails for the most part among the philosophers and theologians of the Middle Ages, seems to express a certain tolerance of the imperfections of language. If men do not think clearly, if they do not reason cogently or argue honestly, the fault is primarily the result of the misuse of their faculties, not of the betrayal of their in-

tentions by the intractable character of language as an instrument. Even when men misunderstand one another, the inadequacy of language as a medium of communication is not solely responsible for the failure of minds to meet through the interchange of words. With greater effort, with a more assiduous application of the liberal arts, men can succeed even if language works against them.

Some things are inexpressible in human speech even as they are incapable of being fully grasped by human thought. "My vision," Dante says when he reaches the mystic rose of Paradise, "was greater than our speech." Such knowledge as we can have of "the highest matters and the first principles of things" Plato thinks "does not admit of exposition like other branches of knowledge." In his *Seventh Letter*, he even goes so far as to say that "no man of intelligence will venture to express his philosophical views in language."

With these exceptions the ancients seem to adopt a mood of tolerance towards language. This does not imply an underestimation of the difficulties of using language well. It simply does not make of language an insidious enemy of clarity and truth. The deficiencies of language are like the weaknesses of the flesh. As man can in large part overcome them through the discipline of the moral virtues, so through the discipline of the liberal arts—by skill in grammar, rhetoric, and logic—he can make language express almost as much truth as he can acquire, and communicate it almost as clearly as he can think it. Men need not succumb to the tyranny of words if they will make the requisite effort to master language to serve their purpose.

But the liberal arts do not guarantee purity of purpose. Obscurantism, obfuscation, deception, and falsification are sometimes the aim. Men try to persuade others at all costs, or to win the argument regardless of where the truth lies. They try to confuse their opponents or mislead their audience. The use of language for such ends requires as much skill as its employment in the service of truth. If such use is a misuse, then language is equally available for use or misuse.

It is an ancient saying that only the competent in grammar can make grammatical errors intentionally. So, as Plato recognizes, the dif-

ference between the sophist and the philosopher is not one of skill but of purpose. When he criticizes the trickery of sophistical argument, he also acknowledges the cleverness with which the sophists juggle words and propound absurdities under the cover of superficially significant speech. The sophistical fallacies which Aristotle enumerates are seldom accidental errors. Far from being the result of the impediments which language places in the way of thought, they are in large measure artfully contrived equivocations. They are ways of using language against logic. According to Aristotle, they represent "foul fighting in disputation" and are resorted to only by "those who are resolved to win at all costs."

IN THE MODERN treatment of language there is more of an imputation that words cause men unwittingly to deceive themselves as often as they enable one man intentionally to deceive another. Men are duped or tricked by the tendency of words to counterfeit a reality which does not exist. This, in the view of Hobbes or Locke, Berkeley or Hume, is particularly true of general or universal names—or words that signify nothing which can be perceived or imagined.

We cannot imagine anything infinite, says Hobbes. Hence a word like "infinite" is a form of absurd speech "taken upon credit (without any signification at all) from deceived philosophers and deceived, or deceiving, Schoolmen." In addition to the deceptions of ordinary ambiguity and of metaphorical speech, Hobbes pays particular attention to the absurd, insignificant, or nonsensical use of words "whereby we conceive nothing but the sound"; he gives as examples, not merely "round quadrangle," but "infused virtue," "free will," and "immaterial substance."

In the light of the examples, this theory of insignificant or meaningless speech explains what Hobbes means when he says that "words are wise men's counters, they do but reckon by them; but they are the money of fools." It also indicates how Hobbes uses the susceptibility of men to self-deception through language as a way of explaining the errors—he calls them "absurdities"—into which his predecessors have fallen. What is novel here is not that he disagrees with

earlier thinkers on points of psychology and metaphysics or theology, but that he reduces what might be supposed to be an issue between true and false opinions to a difference between significant and absurd speech. His opponents might reply that unless his own views about matter and mind are true, his semantic criticism of them does not hold. They have been seduced by language into talking nonsense only if Hobbes is right in his metaphysics and psychology.

The criticism of arguments which seem to rely on metaphors is not peculiarly modern. In his attack on the Platonic theory of ideas, Aristotle dismisses the statement that the Forms "are patterns and other things share in them" as a use of "empty words and poetical metaphors." But Hobbes carries this method of criticism much further. He frequently rests his case against other philosophers entirely on the ground that they are talking nonsense. Though he himself catches the imagination, almost as often as Plato does, by his skillfully wrought metaphors, he would insist that what he says can always be rendered literally, whereas the metaphors of others conceal the insignificance of their speech.

Bacon provides another illustration of the modern attitude which ascribes a diabolical character to language. "There arises from a bad and unapt formation of words," he writes, "a wonderful obstruction to the mind. Nor can the definitions and explanations with which learned men are wont to guard and protect themselves in some instances afford a complete remedy—words still manifestly force the understanding, throw everything into confusion, and lead mankind into vain and innumerable controversies and fallacies." He goes on to say that "the idols imposed upon the understanding by words are of two kinds. They are either names of things which have no existence . . . or they are names of actual objects, but confused, badly defined, and hastily or irregularly abstracted from things."

Here, as in the case of Hobbes, a theory of reality and of the way in which the mind draws its ideas from experience seems to underlie the charge that language tangles the mind in a web of words, so that it deals with words rather than with things. In the same spirit, though not from the same premises, Locke tells his reader why

he found it necessary to include in his *Essay Concerning Human Understanding* the long third book on language, which examines in detail the imperfections as well as the abuses of words, and the remedies therefor.

"Vague and insignificant forms of speech, and abuse of language," he says, "have so long passed for mysteries of science; and hard or misapplied words with little or no meaning have, by prescription, such a right to be mistaken for deep learning and height of speculation, that it will not be easy to persuade either those who speak, or those who hear them, that they are but the covers of ignorance, and hinderance of true knowledge. . . . So few are apt to think they deceive, or are deceived in the use of words or that the language of the sect they are of has any faults in it."

Without judging the fundamental issues involved concerning the nature of things and of man and his mind, one point seems to be clear. According as men hold different conceptions of the relation of language to thought (and in consequence assume different attitudes toward the imperfections or misuse of language), they inevitably take opposite sides on these issues. Whether the discipline of language is called semantics or the liberal arts, the standards by which one man criticizes the language of another seem to depend upon what he holds to be true.

The present work on the great ideas aims, in part, to record the agreements and disagreements among the great minds of the western tradition. It also records how those minds have used the same word in different senses or have used quite distinct words for the same thing. It could not do either unless it did both. This indicates the basic relationship between language and thought which the great books exemplify, even when they do not explicitly make it the basis of their discussion of the relation between language and thought.

THE IDEAL OF A perfect and universal language seems to arise in modern times from dissatisfaction with the inadequacy of ordinary language for the analytical refinement and precision of mathematics or science. As Descartes holds up the method of mathematics as the procedure to be followed in all other inquiries and subject matters, so his conception of a "universal mathe-

sis" calls for a language which shall be the perfect instrument of analysis and demonstration.

It is sometimes supposed that the symbolism of mathematics is itself that perfect language. Lavoisier quotes Condillac to the effect that algebra, "in the most simple, most exact, and best manner, is at the same time a language and an analytical method." Of the analytical equations "which Descartes was the first to introduce into the study of curves and surfaces," Fourier remarks that "they extend to all general phenomena. There cannot be a language more universal and more simple, more free from errors and obscurities, that is to say, more worthy to express the invariable relations of natural things. . . . Its chief attribute is clearness; it has no marks to express confused notions. . . . It follows the same course in the study of all phenomena; it interprets them by the same language."

This praise of mathematical symbolism indicates that one feature of the ideal is an exact correspondence between words and ideas. "Like three impressions of the same seal," Lavoisier says, "the word ought to produce the idea, and the idea to be a picture of the fact." If there were a perfect one-to-one correspondence between physical symbols and mental concepts, there would never be any failures of communication. Men would be able to understand each other as well as if they could see directly into each other's minds. Though they still used external signs as a medium of communication, they would approximate the immediate communication which the theologians attribute to angels. In addition, the process of thinking itself, quite apart from communication, could be perfectly regulated by the rules of grammar—the rules for manipulating symbols.

In the sense in which Lavoisier says that "the art of reasoning is nothing more than a language well arranged," the rules of thought might be reduced to the rules of syntax if there were a perfect language. If the symbols of mathematics lack the universality to express every sort of concept, then it may be necessary, as Leibnitz proposes, to construct a "universal characteristic" which would make possible a symbolic calculus for the performance of all the operations of thought. This conception seems to contain the principle and the motivation for the various logistical schemes which accompany the

modern development of symbolic or mathematical logic, from Boole and Venn to Peano, Couturat, Russell, and Whitehead. The hopes to be realized by an algebra of logic find expression in Jevons' plan for a logical abacus which, like an adding machine or comptometer, would be a thinking machine able to solve all problems that can be put in suitable terms.

IS THE IDEAL of a perfect and universal language a genuine hope or a utopian dream? Not all modern scientists seem to agree with Lavoisier's point that the improvement of a science and the improvement of its language are inseparable. Faraday, for example, apologizing for the invention of new words to name electrical phenomena, says that he is "fully aware that names are one thing and science another." The utopian character of the ideal seems to be implied in Swift's satirization of a universal language. On his voyage to the cloud-land of the scientists in Laputa, Gulliver learns of a project which is being considered by the professors of language. "Since words are only names for things, it would be more convenient for all men to carry about them such things as were necessary to express the particular business they are to discourse on." The substitution of things for words would thus provide a "universal language to be understood in all civilized nations."

In the ancient world the imperfection of ordinary speech gives rise, not to the conception of a perfect language which man should try to construct, but to the consideration of the distinction between a hypothetical natural language and the existing conventional languages actually in use. If there were a natural language, it would not only be the same for all men everywhere, but its words would also be perfect images or imitations of things. That human language is conventional rather than natural may be seen not only in the plurality of tongues, but also in the fact that existing languages embody contradictory principles of symbolization.

This fact, Plato suggests in the *Cratylus*, indicates that human language does not originate as a gift from the gods, for if the gods had given men the names they use, signs would be perfectly and consistently adapted to things signified. The hypothesis of a natural or god-given language is not proposed as an ideal to inspire

men to try to invent a perfect language for themselves. It functions rather as a norm for the criticism of man-made language and for discovering the natural elements common to all conventional languages.

Like human society, human language seems to be partly natural, partly conventional. As there are certain political principles, such as that of natural justice, common to all societies despite the diversity of their customs and institutions, so all conventional languages have certain common characteristics of structure which indicate their natural basis in the physical and mental constitution of man. In the tradition of the liberal arts, the search for a universal grammar, applicable to all conventional languages, represents not the hope to create a universal or perfect language, but the conviction that all languages have a common, natural basis.

THE HYPOTHESIS of a natural language takes another form and has another implication in the Judaeo-Christian tradition, where it is discussed in the light of certain portions of revelation. Yet it retains the same fundamental relevance to the problem of the origin and characteristics of the many conventional languages which now exist.

Genesis relates how, after God formed every beast of the field and every fowl of the air, He "brought them to Adam to see what he would call them; and whatsoever Adam called every living creature, that was the name thereof." The names which Adam devised constituted a natural language, at least insofar as, according to Augustine's interpretation, it is the one "common language of the race" both before the flood and for some time after. But there is the further question whether the names which Adam gave to things were their rightful or proper names—whether they were natural signs in the sense of true representations of the natures of the things signified.

Hobbes suggests one answer when he says that "the first author of speech was God himself, who instructed Adam how to name such creatures as he presented to his sight"; Augustine suggests another answer by identifying the original language of man with Hebrew, and by affirming the continuity of the Hebrew spoken after Babel with the language all men spoke before the confusion of tongues.

At the time when men began to build "a tower whose top may reach unto heaven," Genesis tells us that "the whole earth was of one language and one speech. . . . And the Lord said, Behold, the people is one, and they have all one language; and this they begin to do; and now nothing will be restrained from them, which they have imagined to do. Go to, let us go down, and there confound their language, that they may not understand one another's speech."

This, according to Hobbes, means that the language "gotten and augmented by Adam and his posterity, was again lost at the tower of Babel, when by the hand of God every man was stricken for his rebellion, with an oblivion of his former language." If the further implication is that the lost language was unlike any of the conventional languages in the historical record, then it may be supposed to have been that natural form of speech in which each thing is named according to its nature. The modern ideal of a perfect and universal language may even be looked upon as an impious wish to achieve what God took away from men at Babel.

THE PROBLEM of the origin of human language is not an easy one for the theologian. It is more difficult still for those who speculate about it in purely naturalistic terms. Rousseau tries to expose some of the perplexities in such speculations.

If speech did not become a social necessity until men passed from isolation in a state of nature to living together in society, how, he asks, could societies have been formed before languages had been invented? "If men need speech to learn to think," he remarks, "they must have stood in much greater need of the art of thinking, to be able to invent that of speaking." The development of languages already in existence, or the way in which the child learns to speak through living in an environment where speech exists, "by no means explains how languages were originally formed."

Rousseau imagines a primitive condition in which men uttered instinctive cries "to implore assistance in case of danger, or relief in case of suffering"; he supposes that to such cries, men may have added gestures to signify visible and

movable objects, and imitative sounds to signify audible ones. Such methods of expression being insufficient to convey ideas about absent or future things, men had at last to invent "the articulate sounds of the voice" and to institute these as conventional signs. But, as he observes, "such an institution could only be made by common consent . . . itself still more difficult to conceive, since such a common agreement must have had motives, and speech, therefore, seems to have been highly necessary in order to establish the use of it."

The problem of the origin of human language is not only connected with the problem of the origin of human society, but also with the problem of the origin of man himself. The faculty of articulate speech does not, according to Darwin, "offer any insuperable objection to the belief that man has been developed from some lower form." Though the habitual use of articulate language is peculiar to man, "he uses, in common with the lower animals, inarticulate cries to express his meaning, aided by gestures and the movements of the muscles of the face." The songs of birds and the speech of parrots show that animals can learn to make and repeat certain definite sounds, and even to connect words with things. It seems to Darwin quite credible that man's articulate language "owes its origin to the imitation and modification of various natural sounds, the voices of other animals, and man's own instinctive cries, aided by signs and gestures."

SUCH AN ACCOUNT of the origin of human speech is not credible, however, to those who disagree with Darwin's statement that "the lower animals differ from man solely in his almost infinitely larger power of associating together the most diversified sounds and ideas." Those who hold that human rationality differs in kind, rather than degree, from animal intelligence tend to find a corresponding difference in kind between human language and the sounds of brutes. Aristotle, for example, says that man is the only animal whom nature "has endowed with the gift of speech. Mere vocalization is only an indication of pleasure and pain and is therefore found in other animals," but men alone have the power to discuss the expedient and the just, and this fact distinguishes human

association from the companionship of gregarious animals.

Human speech is, for Descartes, one of the two criteria by which we can "recognize the difference that exists between men and brutes. For it is a very remarkable fact that there are none so depraved and stupid, without even excepting idiots, that they cannot arrange different words together, forming of them a statement by which they can make known their thoughts; while, on the other hand, there is no other animal . . . which can do the same. It is not the want of organs that brings this to pass, for it is evident that magpies and parrots can utter words just like ourselves, and yet they cannot speak as we do, that is, so as to give evidence that they think of what they say. . . . This does not merely show that the brutes have less reason than men, but that they have none at all."

The difference between men and other animals is more fully discussed in the chapter on MAN. Here we are concerned with opposite opinions on that subject only in relation to opposite views of human language and its origin. When, as in Descartes' view, human language is distinguished by syntax and grammar or, as in Locke's, by man's special power to use sounds "as signs of internal conceptions, and to make them stand as marks for ideas within his own mind," the origin of human speech does not seem explicable in evolutionary terms.

THE RELATION OF grammar to the other liberal arts and to the various uses of language is considered in the chapters on LOGIC, POETRY, and RHETORIC. Isolated from these others, grammar is primarily concerned with the distinction of the parts of speech, such as noun and verb, or particle and adjective.

"By a noun," says Aristotle, "we mean a sound significant by convention, which has no reference to time, and of which no part is significant apart from the rest." In contrast to the noun, the verb is defined by Aristotle as the sort of word which, "in addition to its proper meaning, carries with it the notion of time. . . . Moreover," he continues, "a verb is always a sign of something said of something else." The grammatical function of nouns and verbs is, in Locke's opinion, more generally

recognized and better defined than that of particles, prepositions, and conjunctions. Such words, Locke writes, "show what connexion, restriction, distinction, opposition, emphasis, etc. [a man] gives to each respective *part* of his discourse. . . . He who would show the right use of particles, and what significancy and force they have, must take a little more pains, enter into his own thoughts, and observe nicely the several postures of his mind in discoursing."

Grammar is also concerned with the difference between words (or phrases) and sentences, or, in Aristotle's terms, between simple and composite expressions; and with the rules of syntax which govern the order and agreement of words according to their function as parts of speech. By reference to these rules the grammarian criticizes the misuse of language and classifies a great variety of common errors.

One test of whether grammar is a universal art applicable to all languages—not just a set of rules for using a particular conventional language correctly—is the naturalness of its theoretical distinctions. Does Aristotle's distinction between noun and verb, for example, respond to something natural in all discourse, or is it peculiar to the Greek or to the Indo-European languages?

THERE IS A MEANING of language which includes more than the speech of men and brutes. From Hippocrates on, the physician regards the symptoms of disease as if they were a connected system of signs, a language for which his diagnostic art provides a grammar of interpretation. This is particularly true in the psychological realm where, in the psychoanalysis of the neuroses and especially in Freud's interpretation of dreams, both symptom and dream-symbol are treated as an elaborate language. That language serves to express the unconscious thoughts and desires which cannot be expressed in the ordinary language of social intercourse over which consciousness exercises some control.

These medical examples represent a conception of language according to which the whole of nature is a book to be read by the scientist. He penetrates the mysteries of nature by learning the grammar of natural signs. To know the relation of natural things as cause and effect or

whole and part is to discover nature's syntax. According to another conception, expressed by Galileo, the book of nature "is written in mathematical language, its symbols being triangles, circles, and other geometrical figures, without whose help it is impossible to comprehend a single word of it."

The book of nature may also be read as the language of God. Prophecy or divination is such a reading of dreams or of other events as omens and portents which bespeak the divine purpose. When he reaches the highest heaven Dante finds in the vision of the Trinity, "bound up with love in one volume, that which is dispersed in leaves through the universe." Berkeley goes further than this. All of the ideas which man gets by sense-perception are words in a divine vocabulary. The uniform appearances of nature "may not unfitly be styled the Language of its Author, whereby He discovers His attributes to our view and directs us how to act for the convenience and felicity of life."

God speaks to man in still another way. Within the Judaeo-Christian tradition at least, God is believed to have revealed himself to man through the vehicle of human language. Written by men under divine inspiration, Sacred Scripture is the word of God. Because it is at once human and divine, this language is the most difficult for man to interpret.

The art of interpreting the Bible involves the most elaborate theory of signs, and of the types and levels of meaning. It involves special rules of reading. The development of this theory and these rules by Augustine and Aquinas, Maimonides and Spinoza, Hobbes and Pascal, has deepened the liberal arts and enlarged the scope of man's understanding of other languages—his own or nature's. Since the heart of this larger consideration of language lies in the analysis of meaning and the modes of signification, the discussion of the symbolism of nature and the word of God belongs to the chapter on SIGN AND SYMBOL; and, in its theological aspects, to the chapters on PROPHECY and RELIGION.

THE DISCUSSION of language, as we have seen, cannot be separated from the consideration of human nature and human society. Because He "designed man for a sociable creature," God, according to Locke, "made him not only with

an inclination, and under a necessity to have fellowship with those of his own kind, but furnished him also with language, which was to be the great instrument and common tie of society."

It is not merely that the fellowship of men depends upon speech. According to Locke, men cannot enjoy "the comfort and advantage of society . . . without the communication of thoughts." The fact that "man had by nature his organs so fashioned as to be fit to frame articulate sounds . . . was not enough to produce language"—at least not human language, "for parrots, and several other birds, can be taught to make articulate sounds distinct enough," and yet, Locke writes, they are "by no means capable of language. Besides articulate sounds, therefore, it was further necessary," he insists, that the sounds men formed should be the instrument whereby "the thoughts of men's minds [are] conveyed from one to another."

Rousseau, on the other hand, seems to think that under the primitive circumstances surrounding the origin of both society and language, the association of men "would not require a language much more refined than that of rooks or monkeys, who associate together for much the same purpose. Inarticulate cries, plenty of gestures and some imitative sounds, must have been for a long time the universal language," he writes; "and by the addition, in every country, of some conventional articulate sounds . . . particular languages were produced; but these were rude and imperfect, and nearly such as are now to be found among some savage nations."

The plurality of conventional, historic languages seems to parallel the plurality of the nations or societies into which mankind is divided. But underlying the diversity of tongues there is also a unity which implies the possibility of mankind's unification. To the extent that language expresses thought, diverse languages are but different mediums for the same thing. "All men [may] not have the same speech sounds," Aristotle declares, "but the mental experiences, which these directly symbolize, are the same for all."

The human community conceived in terms of the communication of thought extends as far

as the bounds of such communication among men. It is not limited by political boundaries. It overcomes by translation the barriers set up by a diversity of tongues. It includes the living and the dead and extends to those as yet unborn. In this sense, human civilization can be described as the civilization of the dialogue, and the tradition of the great books can be conceived as the great conversation in which all men can

participate. The extent of this conversation measures the range of western thought. The vocabulary of its language is the stock of ideas with which each individual can begin to think for himself when he turns from dialogue to soliloquy; for, as Plato observes, "thought and speech are the same, with this exception, that what is called thought is the unuttered conversation of the soul with itself."

OUTLINE OF TOPICS

	PAGE
1. The nature and functions of language: the speech of men and brutes	950
1a. The role of language in thought	951
1b. The service of language to society	
2. Theories of the origin of language	952
2a. The hypothesis of one natural language for all men	
2b. The genesis of conventional languages: the origin of alphabets	
3. The growth of language	
3a. The invention of words and the proliferation of meanings	
3b. The spoken and written word in the development of language	953
3c. Tradition and the life of languages	
4. The art of grammar	
4a. Syntax: the parts and units of speech	
4b. Standards of correctness in the use of language: grammatical errors	
5. The imperfections of language	954
5a. The abuse of words: ambiguity, imprecision, obscurity	
5b. Insignificant speech: meaninglessness, absurdity	955
6. The improvement of speech: the ideal of a perfect language	
7. Grammar and logic: the formulation and statement of knowledge	
8. Grammar and rhetoric: the effective use of language in teaching and persuasion	956
9. The language of poetry	
10. The language of things and events: the book of nature; the symbolism of dreams; prophetic signs	957
11. Immediate communication: the speech of angels and the gift of tongues	959
12. The language of God or the gods: the deliverances of the oracles; the inspiration, revelation, and interpretation of Sacred Scripture	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature and functions of language: the speech of men and brutes

Chapter 46: LAW

INTRODUCTION

THE notion of law is associated with a diversity of subject matters, and its meaning undergoes many variations as the discussion shifts from one context to another. The most radical difference separates the way in which natural scientists use the term *law* from the way in which it is used in the arts and in morals or politics.

We ordinarily think of law as a rule—a command or a prohibition—which should be obeyed and can be disobeyed. Both alternatives are usually present. Though the duty or obligation which a law creates is one of obedience, there would be no moral significance to discharging this duty if the law could not be violated. But the laws of nature which the scientist tries to discover do not have this characteristic. They are inviolable. The so-called law of gravitation, for example, or Newton's three laws of motion, cannot be disobeyed. Scientists may disagree about the truth of any formulation of a natural law, but if the formulation is valid, then the general rule of behavior is supposed to obtain without exception; and if exceptions are found, they are not interpreted as instances of disobedience, but rather as cases to which the law does not apply.

The rules of an art may be violated, either unwittingly or intentionally. For example, grammatical errors can be made by those ignorant of the rules or by those who wish to disregard them. The so-called "law of contradiction" in the art of logic seems to be like the rules of grammar or of any other art. Men certainly contradict themselves in spite of the rule which places the penalty of error on those who make contradictory statements.

But according to another conception of the law of contradiction, which belongs to the science of metaphysics rather than to the art of logic, nothing can both be and not be at the

same time in the same respect. This law of being, like the laws of motion, is regarded as inviolable by those who think it true. In this it has the aspect of a scientific or natural law. The law of contradiction, conceived as a rule of logic, may also be natural in the sense of *not being man-made*. In the opinion of certain philosophers, man does not invent either the metaphysical rule which all existences *must* observe or the logical rule which the human mind *should* always obey. He discovers both.

There still remains that other class of rules to which the word "law" is most commonly applied. These are rules of moral action or social conduct which, like rules of art, are essentially violable. "Laws, in their most general signification," Montesquieu writes, "are the necessary relations arising from the nature of things. In this sense all beings have their laws." But he points out that law operates differently in the realm of physical nature and in the realm of intelligent beings like man. The latter, he says, "does not conform to [its laws] so exactly as the physical world. This is because, on the one hand, particular intelligent beings are of a finite nature, and consequently liable to error; and on the other, their nature requires them to be free agents." Hence, even the laws "of their own instituting, they frequently infringe."

The profound division between laws of nature and laws of human conduct thus seems to involve two points: (1) the former may apply to all things, the latter are addressed to man alone; (2) the former, being inviolable, state the necessities of behavior, the latter, precisely because they are violable, imply freedom in those to whom they are addressed.

These two kinds of law have this much in common. Both the laws of nature discovered by the scientist and the rules of conduct instituted by the legislator are general rather than particu-

lar. Their generality has been made, in the tradition of jurisprudence, the basis for differentiating rules of law from particular decisions or decrees. On theological grounds, however, the two kinds of law can be said to have a more significant characteristic in common.

Aquinas conceives the laws of nature which the scientist discovers as laws implanted in the very nature of things at their creation by God. The laws which God implants in human nature do not differ in their eternal origin in the divine intellect and will, or in their manifestation of the divine government of the world. They differ only in that it is part of man's nature to be free and therefore able to disobey even the rules of his own nature. Thus both sorts of law are directions of behavior. Only if the laws which science discovers are not attributed to God, will they seem to be merely descriptive rather than prescriptive.

In this chapter we shall be primarily concerned with law as a direction of human conduct or, as Kant would say, law in the sphere of freedom. But within the one meaning of law which concerns us here, there are still many important distinctions of type. The division of law into divine and human, natural and positive, private and public, moral and political—to name only some of the traditional distinctions—determines the outlines of the diverse philosophies of law which the great books contain, and underlies the great issues concerning the origin, the properties, and the authority of law.

DIFFERENT WRITERS use different criteria to set up their classification of the kinds of law. It is nevertheless possible to perceive certain parallels in analysis and classification. The opposite of natural law is sometimes called "human law," "positive law," or "written law," sometimes "civil law" or "municipal law." Sometimes, as with Kant, for whom the analysis of law derives from an analysis of rights, the differentiation between natural and positive right is also expressed in terms of innate and acquired right, public and private right.

Thus, for Kant, "natural right rests upon pure rational principles *a priori*; positive or statutory right is what proceeds from the will of a legislator. . . . Innate right is that right which belongs to everyone by nature, independent of

all juridical acts of experience. Acquired right is that right which is founded upon such juridical acts." From natural or innate right develops "the system of those laws which require no external promulgation" and which therefore belong to the sphere of private right. Positive or civil rights are the acquired rights of men living in a state of civil society under "the system of those laws which require public promulgation" and which therefore belong to the sphere of public right. The source of differentiation here seems threefold: whether the right is inherent in human nature or acquired from the state; whether men are viewed as living in a state of nature or as living in a civil society; whether the laws do or do not need to be publicly promulgated.

The distinction between the state of nature and the state of civil society is used by many other writers in differentiating between natural and positive (or civil) law, *e.g.*, by Hobbes, Spinoza, Locke, Montesquieu, Rousseau. They also recognize that the law which governs men living in a state of nature is natural in the sense of being instinctive, or a rule of conduct which man's reason is innately competent to prescribe; whereas the civil law originates with specific acts of legislation by a political power, vested in a sovereign person, in a representative assembly, or in the whole body of the people.

Dividing all laws into two kinds—"laws of nature and laws of the land"—Hegel holds that "the laws of nature are simply what they are and are valid as they are." In contrast, positive law is "valid in a particular state, and this legal authority is the guiding principle for the knowledge of right in this positive form, *i.e.*, for the science of positive law." Our manner of knowing their content further distinguishes between these two kinds of law. "To know the law of nature," Hegel explains, "we must learn to know nature, since its laws are rigid, and it is only our ideas about them that can be false. . . . Knowledge of the laws of the land is in one way similar, but in another way not. These laws too we learn to know just as they exist . . . But the difference in the case of laws of the land is that they arouse the spirit of reflection, and their diversity at once draws attention to the fact that they are not absolute."

This leads us to the heart of the distinction. The law of the land, or civil law, is "something posited, something originated by men." It is positive law in the sense that it must be *posited* (i.e., officially instituted) in order to exist. The civil law is not something *discovered* by examining man's nature. It is *made*, and must be externally promulgated so that those who are subject to it can learn its provisions. Anyone who will inquire can learn the natural law for himself; or he can be helped to discover it by a teacher who instructs him in this matter as he would instruct him in geometry, not as a lawyer informs clients concerning the prevailing laws of the state.

AQUINAS BOTH subtracts from and adds to this analysis of the difference between natural and positive law. On the one hand, he does not appeal to the condition of man in a state of nature as contrasted with civil society. On the other hand, he finds the chief difference between the natural and the positive law in their originating sources. The one is made by God, the other by man. "The natural law," Aquinas writes, "is nothing else than the rational creature's participation in the eternal law." It is God's eternal law with respect to man as that is received and exists in human nature. It exists in man as the first principle of his practical reason and includes all the precepts which can be discovered by reasoning therefrom.

Hence, for Aquinas as for Locke, the law of nature is not only the law of reason but the law of nature's God. But Aquinas distinguishes between the law of nature generally, or the eternal law, and the natural law in man. The latter is a *moral* law, both in the sense that it is a law governing free acts, and also in the sense that it directs man with regard to good and evil in the sphere of his private life, not merely with regard to the political common good.

Natural and positive law are alike in the very respects in which they differ. Both share in the nature of law which, according to Aquinas, "is nothing else than an ordinance of reason for the common good, made by him who has care of the community, and promulgated." Each has a maker, God or man; each proceeds in a certain way from the reason and will of its maker; each must be promulgated, though not in the same

manner; and each is concerned with a common good—human happiness or the welfare of the state.

The further additions which Aquinas makes consist of distinctions with respect to divine and human law. With respect to the divine law he distinguishes between God's eternal ordinances and His positive commandments. The eternal part of the divine law, as we have seen, is that which, at the moment of creation, "God imprints on the whole of nature" to instill in each created species "the principles of its proper actions." "If man were ordained to no other end than that which is proportionate to his natural faculties," Aquinas writes, "there would be no need for man to have any further direction . . . besides the natural law and the human law which is derived from it." But "man is ordained to the end of eternal happiness"; and since salvation is a supernatural end which exceeds man's power to achieve without God's help, "it was necessary that . . . man should be directed to this end by a law given by God."

God gave such a body of law to man, not at creation, but at a certain moment in history. He did not implant it in his nature but promulgated it, in the manner appropriate to positive law, through verbal declaration—through His revealed word in the Old and the New Testaments, e.g., the Ten Commandments and the two precepts of charity.

The human law Aquinas divides "into the *law of nations* [or the *ius gentium*] and *civil law*." The civil law is that which is instituted by a community for its own members. With regard to the *ius gentium* Aquinas follows the tradition of the Roman jurists. What he has in mind in using this term should, therefore, not be confused with what later writers, such as Grotius, treat as the *ius inter gentes* or international law. Yet applicable to both the law of nations and international law is the question whether such law belongs more properly to the sphere of natural or to the sphere of positive law.

International law concerns the relations between autonomous states which, as Hegel points out, are "in a state of nature in relation to one another," since "the sovereignty of a state is the principle of its relations to others." Laws cannot be applied to sovereign states with the coercive force of positive law. "It follows," says

Hegel, "that if states disagree and their particular wills cannot be harmonized, the matter can only be settled by war." His statement that international law "does not go beyond an ought-to-be" separates it from positive law. On similar grounds Aquinas separates the *ius gentium* from positive law. He recognizes, as will presently appear, that it does not result from legislative enactment. Furthermore, he points out that it is discovered by reason and derives its rules by way of deduction from natural law. The law of nations is, therefore, not positively instituted.

That the law of nations lacks some of the properties of civil law does not make it, for Aquinas, less essentially a body of law; but for Hegel it falls short of the essence of law, which consists in a determinate and universal rule of right posited by a sovereign will. The great legal positivists of the 19th century, such as Austin, go further and deny that anything is truly law except the positive enactments of a government which has the power to enforce its ordinances. The laws of nature are laws only in a metaphorical sense.

The Greeks also appear to regard law as primarily a creation of the state. Aristotle conceives political justice as "part natural, part legal—natural, that which everywhere has the same force and does not exist by people's thinking this or that; legal, that which is originally indifferent, but when it has been laid down is not indifferent." This tends to identify the legal aspect of justice with the conventional. The threefold division of law into civil law, law of nations, and natural law is not Greek but Roman in origin.

Yet the Greeks do not hold that all law is of human institution or merely a matter of local convention. The fundamental opposition between the divine law and the man-made law of the state occurs frequently in the Greek tragedies, and with particular force in the *Antigone* of Sophocles. In burying her brother, Antigone violates the king's edict, but, in her view, not to have done so would have been to violate the "unwritten statutes of heaven" which, she declares, are "not of today or yesterday, but from all time, and no man knows when they were first put forth. Not through dread of any human pride," she says, "could I answer to the gods for breaking these."

Aristotle cites this passage from Sophocles when, in his *Rhetoric*, he advises the forensic orator (or trial lawyer) "to appeal to the universal law, and insist on its greater equity and justice," if "the written law tells against our case." Under such circumstances, he thinks it is wise to "urge that the principles of equity are permanent and changeless, and that the universal law does not change either, for it is the law of nature, whereas written laws often do change." Under the opposite circumstances, that is, when "the written law supports our case," he prescribes an opposite course—to cite the laws of the state and to urge that they be upheld.

Though Aristotle here speaks of "the law of nature," he seems to have in mind the notion of "a universal law," or a body of law that is *common* to all peoples. For the most part, he speaks of natural justice rather than natural law. Whether or not the two notions are equivalent, his principle of natural justice stands in the same relation to political enactments as, for later writers, the natural law stands to the positive law. Plato's conception of law as "a disposition of reason" which orders things according to their natures, even more explicitly recognizes that law neither depends upon nor derives its authority from the power of the state. The phrase "natural law" may be infrequent in the Greek books, but its meaning is not unrepresented in Greek thought.

OTHER DISTINCTIONS in kinds of law—written and unwritten, statutory and customary, constitutional law and the various particular bodies of law, such as the law of contracts, of crimes, or of torts—are for the most part subdivisions of positive law. The one exception, perhaps, is the unwritten law, which, when not identified with customary law, stands for the natural law or the law of reason. With respect to these parts of law, the chief problems concern constitutions and customs. The difference between a constitution as law and all other laws obtaining in a state is considered in the chapter on CONSTITUTION; and the legal force of custom, both in itself and also in relation to legislative enactments, is discussed in the chapter on CUSTOM.

Here our major concern is with positive law as a whole, with its properties and defects, but above all with its relation to natural law. Some

of the properties of positive law are agreed upon even by those who sharply disagree concerning its relation to natural law.

It is generally agreed, for example, that a rule of positive law cannot be made by *any* man, but only by him who exercises the legislative authority and has the power to enforce the rule. Agreement also prevails concerning the mutability of positive law, though not all would go as far as Montaigne in holding that "there is nothing more subject to perpetual agitation than the laws." Yet it is generally recognized that the content of positive law continually undergoes change with the nullification or amendment of old rules and the addition of new ones, and that positive regulations on any particular matter may vary from state to state.

No less common is the understanding of the indispensability of courts and judges. "Laws are a dead letter without courts to expound and define their true meaning and operation," Hamilton writes. Though rules of law, in distinction from decrees, are formulated to cover an indefinite number of like cases, the cases to which they must be applied by the judicial process are far from uniform. Courts and judges have the task of deciding whether the facts of the particular case bring that case under the specific provisions of the law. This is the field of judicial discretion and the battleground of litigants and lawyers.

The propensities of men of law, on the bench and at the bar, to protract and complicate the procedures of a trial, to multiply and divide the issues, to separate themselves from laymen by a heavy curtain of language, have been satirically noted in the great diatribes against the legal profession, from Aristophanes to Chaucer, Rabelais, Montaigne, and Swift.

Rabelais, for example, has Pantagruel undertake to arbitrate in the litigation between "Lord Kissbreech, plaintiff of one side, and . . . Lord Suckfist, defendant of the other, whose controversy was so high and difficult in law that the court of parliament could make nothing of it." Pantagruel conducts the proceedings in an unusual style. When the counsellors and attorneys "delivered into his hands the bags wherein were the writs and pancarts concerning that suit, which for bulk and weight were almost enough to load four great couillard

or stoned asses, Pantagruel said unto them, Are the two lords, between whom this debate and process is, yet living?" Upon being told they are alive, "to what a devil, then, said he, serve so many paltry heaps and bundles of papers and copies which you give me? Is it not better to hear their controversy from their own mouths, whilst they are face to face before us, than to read these vile fopperies, which are nothing but trumperies, deceits, diabolical cozenages of Cepola, pernicious slights and subversions of equity."

Furthermore, Pantagruel continues, "seeing the laws are excerpted out of the middle of moral and natural philosophy, how should these fools have understood it, that have, by G—, studied less in philosophy than my mule? In respect of human learning, and the knowledge of antiquities and history, they are truly laden with these faculties as a toad is with feathers. And yet of all this the laws are so full, that without it they cannot be understood. . . . Therefore, if you will that I make any meddling in this process, first, cause all these papers to be burned; secondly, make the two gentlemen come personally before me, and, afterwards, when I shall have heard them, I will tell you my opinion freely, without any feignedness or dissimulation whatsoever." The trial which Pantagruel then conducts, in which the two lords are forced to plead without benefit of counsel, is a choice and proper piece of litigation.

THE PROBLEMS of casuistry, with which Pascal deals at length in his *Provincial Letters*, are sometimes thought of as peculiar to the canon law, but casuistry, in the sense of distinguishing cases and examining them in relation to general rules, necessarily occurs in the judicial application of any body of law. The most difficult cases are those which may fall under the letter of a law but seem to be inconsistent with its spirit. The reverse also happens; cases fall outside the letter of the law but the purpose of the law seems to cover them. All such cases indicate an unavoidable defect in rules of law.

The defect is unavoidable, Aristotle says. Law aims at universality "but about some things it is not possible to make a universal statement which shall be correct." To remedy this defect,

the intention of the lawmaker should be consulted. The particular case should be treated as he would have treated it if he had had it in mind when he framed the general rule. Such handling of the difficult case is what Aristotle means by the equitable—"a correction of the law where it is defective owing to its universality."

The law which equity is called upon to correct may be a just rule, but that does not prevent its being unjustly applied. Equity prevents the injustice of misapplication by dispensing justice in the particular case according to the spirit, not the letter, of the law. It is a kind of justice, Aristotle says; "not legal justice but a correction of legal justice . . . not better than absolute justice but better than the error which arises from the absoluteness of the rule."

Those who share Aristotle's theory of equity acknowledge a standard of justice by which not only the law's application, but also the law itself, is to be measured. In his terms, natural justice provides this standard. The justice of laws made by the state is not only relative to the constitution of the state, but since the constitution itself can be more or less just, there is a standard of justice prior to and independent of the state—in this sense, *natural*.

Essentially the same point is made by those who, like Montesquieu and Locke, appeal to the natural law, both as a measure of constitutions and as a criterion for distinguishing good from bad law. "Before laws were made," Montesquieu writes, "there were relations of possible justice. To say that there is nothing just or unjust but what is commanded or forbidden by positive laws, is the same as saying that before the describing of a circle all the radii were not equal."

The law of nature, according to Locke, does not apply only to the conduct of men living in a state of nature. The law of nature which Locke describes as a rule "of common reason and equity which is that measure God has set to the actions of men for their mutual security," is not abolished when men enter into civil society. "The obligations of the law of nature cease not in society, but only in many cases are drawn closer, and have by human laws known penalties annexed to them, to enforce their observation. Thus the law of nature stands as an eternal rule

to all men, legislators as well as others." The rules of positive law, writes Locke, must "be conformable to the law of nature, *i.e.*, to the will of God, of which that is the declaration." The municipal laws of any particular state "are only so far right as they are founded on the law of nature, by which they are to be regulated and interpreted."

THE POSITION of Locke and Aquinas makes natural law the source as well as the standard of positive law. As a source, natural law gives rise to positive law in a way which, for Aquinas at least, differentiates it from the law of nations or the *ius gentium*.

"Something may be derived from the natural law in two ways," he writes. "First, as a conclusion from premises; secondly, by way of determination of certain generalities. The first way," he explains, "is like to that by which, in sciences, demonstrated conclusions are drawn from the principles; while the second mode is likened to that whereby, in the arts, general forms are particularized as to details: thus the craftsman needs to determine the general form of a house to some particular shape." Now "to the law of nations belong those things which are derived from the law of nature, as conclusions from premises, *e.g.*, just buyings and sellings, and the like, without which men cannot live together, which is a point of the law of nature, since man is by nature a social animal. . . . But those things which are derived from the law of nature by way of particular determination, belong to the civil law, according as each state decides on what is best for itself."

Aquinas exemplifies the determinations of positive law by pointing out that "the law of nature has it that the evildoer should be punished; but that he be punished in this way or that, is a determination of the law of nature," which the positive law must institute. He might also have used as an example the fact that the universal prohibition of killing is a conclusion from the principle of natural law that "*one should do harm to no man*," whereas the various kinds and degrees of murder are differently defined in different countries according to the determination of the natural law made by the positive law of homicide in each country.

The rules of positive law cannot be arrived at deductively. They do not follow necessarily from principles. They are only determinations which particularize the precepts of natural law in a manner which fits the contingent circumstances of a particular society. Whatever is made determinate by positive law is something which the natural law leaves indeterminate because no point of justice or right is involved. Other determinations could have been made. An element of choice is involved in the making of positive laws. In addition to being formulated by the reason, they must be posited by the will of whoever has the authority to make laws.

Rules of positive law are the work of reason to the extent that reason is called upon to propose various *possible* determinations of the natural law, *e.g.*, one or another definition of murder in the first degree, one or another definition of the penalty for it. Since a definite rule of positive law cannot be instituted until a choice is made among the alternative possibilities, the positive law cannot be solely the work of reason. Choice, according to Aquinas, is always an act of the will.

Though he recognizes the role of choice, and hence of the will, in the enactment of positive law, Aquinas does not go to the other extreme of making the will the sole arbiter of what is law. The legality of the state's ordinances does not depend entirely on their being posited by the will of a sovereign authority. If a positive regulation is not derived from the natural law, it cannot be a just rule. Quoting Augustine's remark that "a law which is not just is a law in name only," Aquinas goes on to say: "Every human law has just so much of the nature of law as it is derived from the law of nature. But if in any point it departs from the law of nature, it is no longer a law but a perversion of law."

An ordinance which had no other foundation than the will of a sovereign prince or government might have the coercive force of law, but it would lack the moral authority of law. It would bind men, not through conscience, but only through their fear of punishment for disobedience. "That force and tyranny may be an element in law," writes Hegel, "is accidental to law, and has nothing to do with its nature."

A COMPLETELY opposite view is taken by those who deny natural law or principles of innate right and natural justice. There is, in addition, a theory of natural law which leads to an opposite view of the legal and the just, though the opposition in this case is qualified to some extent.

According to Hobbes, "civil and natural law are not different kinds, but different parts of law." The law of nature and the civil law, he says, "contain each other and are of equal extent." But he also says that "the laws of nature . . . are not properly laws, but qualities that dispose men to peace and to obedience."

Before the formation of a commonwealth, by the contract or covenant whereby men transfer the rights and liberties which they possess in a state of nature, the natural law directs men, first, to preserve their lives in the war "of every man against every man"; and second, to seek the security of peace by leaving the natural state of war to join with their fellow men in the order of a civil society. The nineteen precepts of natural law which Hobbes enumerates seem to set forth reason's recognition of the advantages of civil society over the state of nature and also reason's understanding of the conditions indispensable to a firm foundation of the commonwealth.

These rules of reason "are the laws of nature, dictating peace, for a means of the conservation of men in multitudes, and which only concern the doctrine of civil society." But until the commonwealth exists, the laws of nature bind in conscience only, and they are therefore not effective in achieving their end, which is security. "When a commonwealth is settled, then they are actually laws and not before; as being then the commands of the commonwealth, and therefore also civil laws. For it is the sovereign power which obliges men to obey them."

The distinction between natural and civil law then becomes a distinction between unwritten and written rules; but the test of whether any rule is actually a law is the same, namely, whether it is adopted and enforced by the sovereign. "All laws, written and unwritten, have their authority and force from the will of the commonwealth," Hobbes writes.

The difference between the Hobbesian theory and that of Locke or Aquinas reveals itself in its

consequences. Under what circumstances can a subject or citizen refuse obedience to the laws of the state? On the ground that they are unjust or tyrannical? By the criterion that they violate precepts of natural law or the positive commandments of God? Is the individual bound in conscience to obey every command of the civil law, because the civil law includes the natural law, interprets it, and gives it the authority and force of law; and because the natural law itself commands obedience to the civil law once a commonwealth has been instituted? Or, on the contrary, is an individual in conscience free to disobey those positive enactments which lack the authority of law because they are not in conformity to the natural law or the divine law?

TO QUESTIONS OF THIS sort, and to the whole problem of the right of rebellion, different answers seem to be given in terms of different views of the nature of law, the sources of its authority, and its sanctions.

At one extreme there is the doctrine that rebellion is never justified, that the security of peace, which the maintenance of law and order provides, is always better than the anarchy and war which result from rebellion. Hobbes, for example, holds that "nothing the sovereign representative can do to a subject, on what pretence soever, can properly be called injustice, or injury." The rebel would, therefore, always be a criminal, a man who takes the law into his own hands, and uses force to gain his ends. A man may be justified in using force, according to Hobbes, only to repel force used against him, and then only in defense of his life. So much the law of nature permits or requires. But it does not permit or require him to decide which laws enacted by his sovereign he shall obey or disobey.

At the other extreme there is the doctrine of civil disobedience as expounded by Thoreau and, of course, Gandhi. Unjust laws, or laws which violate a man's conscience, may have the force of the state behind them. But they exert no authority over him. The just man is called upon to break them and to submit gladly to the consequences of breaking them, by suffering whatever penalties may be attached to their breach. It is not enough for the individual citi-

zen to satisfy his conscience by criticizing the government and joining with like-minded fellow citizens in an effort to get unjust laws abolished or reformed. He is obliged in conscience not to await help from others or to be patient in the use of gradual means. He is obliged to act alone and at once—by disobeying the unjust law.

Kant seems to go this far when he interprets the precept "Do wrong to no one" as meaning "Do no wrong to anyone, even if thou shouldst be under the necessity, in observing this duty, to cease from all connection with others and to avoid all society." But he qualifies this somewhat by the precept: "Enter, if wrong cannot be avoided, into a society with others in which everyone may have secured to him what is his own."

Another sort of qualification limits disobedience, rebellion, or secession from society—even when the individual conscience recoils from the injustice or illegality of a civil ordinance. The principle, as stated by Aquinas, seems to be that the common good may, under certain circumstances, be better served by acquiescence than by disobedience. Unless what the law commands involves a transgression of God's commandments, an unjust law may be obeyed "in order to avoid scandal or disturbance."

Even with regard to reforming law by legal means Aquinas recommends that the disadvantages resulting from the change of law be weighed against the advantages. The effectiveness of law depends upon the habits of obedience it forms and upon the customary behavior it establishes. "Consequently," Aquinas says, "when a law is changed, the binding power of law is diminished, in so far as custom is abolished." This harm to the common welfare may, of course, be compensated either by "the benefit conferred by the new enactment" or by the fact that "the existing law is clearly unjust, or its observance extremely harmful."

Locke states the principle somewhat differently. So long as due process of law is available to remedy unjust ordinances or illegal acts, the individual is not justified in disobedience, for such action would "unhinge and overturn all politics, and, instead of government and order, leave nothing but anarchy and confusion." Nor

is it effective for the individual to act alone in using force to resist tyranny or injustice. But if these illegal acts have extended to the majority of the people "and they are persuaded in their consciences, that their laws, and with them their estates, liberties, and lives are in danger, and perhaps, their religion too, how they will be hindered from resisting illegal force used against them, I cannot tell. This is an inconvenience, I confess, that attends all governments." There is no alternative then but rebellion—"properly a state of war wherein the appeal lies only to heaven."

As the foregoing discussion indicates, the basic issues in the philosophy of law are inseparable from questions about justice and liberty, the rights of the individual and the authority of the state, the powers of government, and the fundamental alternatives of crime and punishment, war and peace. These matters are considered in the chapters appropriate to the terms mentioned above. More particular consequences of the theory of law, especially natural law, are found in such chapters as REVOLUTION, SLAVERY, and TYRANNY, CITIZEN, CONSTITUTION, and WEALTH.

OUTLINE OF TOPICS

	PAGE
1. The definition of law	972
1a. The end of law: peace, order, and the common good	
1b. Law in relation to reason or will	973
1c. The authority and power needed for making law	
1d. The promulgation of law: the need and the manner of its declaration	
2. The major kinds of law: comparison of human, natural, and divine law; comparison of natural and positive, innate and acquired, private and public, abstract and civil rights	974
3. The divine law	
3a. The eternal law in the divine government of the universe: the law in the nature of all creatures	
(1) The natural moral law as the eternal law in human nature	
(2) The distinction between the eternal law and the positive commandments of God	975
3b. The divine positive law: the difference between the law revealed in the Old and the New Testament	
(1) Law in the Old Testament: the moral, the judicial, and the ceremonial precepts of the Old Law	
(2) Law in the New Testament: the law of love and grace; ceremonial precepts of the New Law	976
4. The natural law	
4a. The law of reason or the moral law: the order and habit of its principles	
4b. The law of men living in a state of nature	
4c. The <i>a priori</i> principles of innate or abstract right: universal law in the order of freedom; the objectification of the will	
4d. The natural law as underlying the precepts of virtue: its relation to the moral precepts of divine law	977
4e. The relation of natural law to natural rights and natural justice	

4f. The relation of natural law to civil or municipal law: the state of nature and the regulations of the civil state	977
4g. The relation of natural law to the law of nations and to international law: sovereign states and the state of nature	978
4h. The precepts of the natural law and the condition of the state of nature with respect to slavery and property	
5. The human or positive law: the sanction of coercive force	
5a. The difference between laws and decrees	
5b. The kinds or divisions of positive law	979
5c. The justice of positive law: the standards of natural law and constitutionality	
5d. The origins of positive law in the legislative process: the function of the legislator	
5e. The mutability or variability of positive law: the maintenance or change of laws	980
5f. The relation of positive law to custom	
5g. The application of positive law to cases: the casuistry of the judicial process; the conduct of a trial; the administration of justice	981
5h. The defect of positive law: its need for correction or dispensation by equity	982
6. Law and the individual	
6a. Obedience to the authority and force of law: the sanctions of conscience and fear; the objective and subjective sanctions of law; law, duty, and right	
6b. The exemption of the sovereign person from the coercive force of law	983
6c. The force of tyrannical, unjust, or bad laws: the right of rebellion or disobedience	
6d. The educative function of law in relation to virtue and vice: the efficacy of law as limited by virtue in the individual citizen	
6e. The breach of law: crime and punishment	984
(1) The nature and causes of crime	
(2) The prevention of crime	
(3) The punishment of crime	985
7. Law and the state	986
7a. The distinction between government by men and government by laws: the nature of constitutional or political law	
7b. The supremacy of law as the principle of political freedom	
7c. The priority of natural to civil law: the inviolability or inalienability of natural rights	
7d. Tyranny and treason or sedition as illegal acts: the use of force without authority	987
7e. The need for administrative discretion in matters undetermined by law: the royal prerogative	
7f. The juridical conception of the person: the legal personality of the state and other corporations	
8. Historical observations on the development of law and on the diversity of legal systems or institutions	
9. The legal profession and the study of law: praise and dispraise of lawyers and judges	988

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 47: LIBERTY

INTRODUCTION

LIBERTY and law, liberty and justice, liberty and equality—the familiar connection of these terms breeds neglect of the meaning they confer upon one another through association. A few simple questions may help to restore the significance of these relationships. Are men free when their actions are regulated by law or coercion? Does liberty consist in doing whatever one pleases or whatever one has the power to do, or is one required by justice to abstain from injury to others? Do considerations of justice draw the line between liberty and license? Can there be liberty apart from equality and perhaps also fraternity?

Other questions immediately suggest themselves. Does not the rule of law secure liberty to the governed? Is not slavery the condition of those who are ruled tyrannically or lawlessly? Does it make a difference to freedom whether the law or the constitution is just? Or is that indifferent because government itself is the impediment to liberty? Does liberty increase as the scope of government dwindles and reach fullness only with anarchy or when men live in a state of nature?

Yet are not some forms of government said to be fitting and some uncongenial to free men? Do all men have a right to freedom, or only some? Are some men by nature free and some slave? Does such a differentiation imply both equality and inequality in human nature with, as a consequence, equality and inequality in status or treatment? What implications for law, justice, and equality has the distinction between free societies and dependent or subject communities?

As Tolstoy points out, the variety of questions which can be asked about liberty indicates the variety of subject matters or sciences in which the problems of freedom are differently raised. "What is sin, the conception of

which arises from the consciousness of man's freedom? That is a question for theology . . . What is man's responsibility to society, the conception of which results from the conception of freedom? That is a question for jurisprudence . . . What is conscience and the perception of right and wrong in actions that follow from the consciousness of freedom? That is a question for ethics . . . How should the past life of nations and of humanity be regarded—as the result of the free, or as the result of the constrained, activity of man? That is a question for history."

The great traditional issues of liberty seem to be stated by these questions. From the fact that most, perhaps all, of these questions elicit opposite answers from the great books, it might be supposed that there are as many basic issues as there are questions of this sort. But the answers to certain questions presuppose answers to others. Furthermore, the meaning of liberty or freedom or independence is not the same throughout the questions we have considered. Answers which appear to be inconsistent may not be so when the meanings involved in their formulation are distinguished. We must, therefore, find the roots of the several distinct doctrines of liberty in order to separate real issues from verbal conflicts.

THE HISTORIANS report the age-old struggle on the part of men and of states for liberty or independence. History as a development of the spirit does not begin, according to Hegel, until this struggle first appears. "The History of the world," he writes, "is none other than the progress of the consciousness of Freedom," which does not reach its climax until freedom is universally achieved. But though freedom is its product, history, in Hegel's view, is not a work of freedom, but "involves an absolute ne-

cessity." Each stage of its development occurs inevitably.

Other historians see man as free to work out his destiny, and look upon the great crises of civilization as turning points at which free men, that is, men having free will, exercise a free choice for better or for worse. "Whether we speak of the migration of the peoples and the incursions of the barbarians, or of the decrees of Napoleon III, or of someone's action an hour ago in choosing one direction out of several for his walk, we are unconscious of any contradiction," Tolstoy declares, between freedom and necessity. "Our conception of the degree of freedom," he goes on to say, "often varies according to differences in the point of view from which we regard the event, but every human action appears to us as a certain combination of freedom and inevitability. In every action we examine we see a certain measure of freedom and a certain measure of inevitability. And always the more freedom we see in any action the less inevitability do we perceive, and the more inevitability the less freedom."

Accordingly, neither necessity which flows from the laws of matter or of spirit, nor overhanging and indomitable fate determines the direction of events. If the theologians say that nothing happens which God does not foresee, they also say that divine providence leaves the world full of contingencies and man a free agent to operate among them. "Though there is for God a certain order of all causes," it does not follow, Augustine says, that nothing depends "on the free exercise of our own wills, for our wills themselves are included in that order of causes which is certain to God, and is embraced by His foreknowledge, for human wills are also causes of human actions."

These matters are further discussed in the chapters on FATE, HISTORY, and NECESSITY AND CONTINGENCY. The mention of them here suggests another meaning of liberty—that of free choice or free will—and with it issues other than those involved in the relation of the individual to the state or to his fellow men. Yet the metaphysical questions about liberty and necessity, or freedom and causality, and the theological questions about man's freedom under God, are not without bearing on the politi-

cal problems of man's freedom in society, or his rights and powers. The fundamental doctrines of civil liberty certainly seem to differ according to the conception of natural freedom on which they are based. Freedom may be natural in the sense that free will is a part of human nature; or in the sense that freedom is a birth-right, an innate and inalienable right. It may be natural in the sense in which freedom in a state of nature is distinguished from political liberty, or liberty under civil law and government.

THE EFFORT to clarify meanings requires us to look at the three words which we have used as if they were interchangeable—"liberty," "freedom," and "independence." For the most part, "liberty" and "freedom" are synonyms. Both words are used in English versions of the great books. Though authors or translators sometimes prefer one, sometimes the other, their preference does not seem to reflect a variation in meaning.

In English the word "freedom" has a little greater range in that it permits the formation of the adjective "free." It is also adapted to speaking of freedom *from* certain restraints or undesirable conditions, as well as of freedom *to* act in accordance with desire or to exercise certain privileges. In consequence, the word "freedom" is more frequently employed in the discussion of free will. Though the traditional enumeration of civil liberties may use the phrasing "liberty of conscience or worship" as frequently as "freedom of conscience or worship," "freedom of speech" is more usual, and "freedom from fear or want or economic dependence" does not seem to have an alternative phrasing.

The word "independence" has special connotations which make it equivalent to only part of the meaning of "freedom" or "liberty." Negatively, independence is a freedom from limitation or from being subject to determination by another. Positively, independence implies self-sufficiency and adequate power. When we speak of a man of independent means, we refer not only to his freedom from want or economic dependence on others, but also to his having sufficient wealth to suit his tastes or purposes. A moment's reflection will show that this is a relative matter. It is doubtful whether

absolute economic independence is possible for men or even for nations.

The real question here seems to be a metaphysical one. Can any finite thing be absolutely independent? The traditional answer is No. As appears in the chapter on INFINITY, only a being infinite in perfection and power—only the Supreme One of Plotinus, the uncreated God of Aquinas, or the self-caused God of Spinoza—has complete independence. God has the freedom of autonomy which cannot belong to finite things. There is, however, another sense of divine freedom which Aquinas affirms and both Plotinus and Spinoza deny. That is freedom of choice.

"God does not act from freedom of will," Spinoza writes; yet God alone acts as a free cause, for God alone "exists from the necessity of his own nature and is determined to action by himself alone." The divine freedom consists in God's self-determination which, for Spinoza, does not exclude necessity. The opposite view is most clearly expressed in the Christian doctrine of creation. The created world does not follow necessarily from the divine nature. "Since the goodness of God is perfect," Aquinas writes, "and can exist without other things, inasmuch as no perfection can accrue to Him from them, it follows that for Him to will things other than Himself is not absolutely necessary." This issue of freedom or necessity with regard to God's will and action is more fully discussed in the chapters on WILL and WORLD.

The metaphysical identification of independence with infinity does not carry over into the sphere of political freedom. Yet in one respect there is an analogy. The autonomous is that which is a law unto itself. It admits no superior authority. When in the tradition of political thought states are called "free and independent," their autonomy or sovereignty means that by virtue of which, in the words of the Declaration of Independence, "they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent states may of right do."

Free and independent states do not have infinite power. There is always the possibility of their being subjugated by another state and reduced to the condition of a dependency. But

though their power is not infinite, they acknowledge no superior. To be a sovereign is to accept commands from no one.

Since autonomy or sovereignty is incompatible with living under human law or government, the independence of sovereign princes or states must be an anarchic freedom—a freedom from law and government. This seems to be the view of Hobbes, Locke, Kant, and Hegel, all of whom refer to the anarchy of independent states or sovereign princes to explain what they mean by the "state of nature." Sovereigns are, in the words of Kant, "like lawless savages."

Applying this conception to individual men, Hobbes and Locke define natural as opposed to civil liberty in terms of man's independence in a state of nature. In a state of nature man had a limited independence, since each man might be coerced by a superior force; but it was an absolute independence in the sense that he was subject to no human government or man-made law.

THE NATURAL FREEDOM of man, according to Hobbes, is not free will. Since "every act of man's will, and every desire and inclination, proceed from some cause, and that from another cause, in a continual chain (whose first link is in the hand of God, the first of all causes), they proceed from *necessity*." Liberty is not of the will, but of the man, consisting in this: "that he finds no stop in doing what he has the will, desire, or inclination to do." The proper application of the word "free" is to bodies in motion, and the liberty it signifies when so applied is merely "the absence of external impediments."

The natural right of every man is "the liberty each man has to use his own power . . . for the preservation of his own nature, that is to say, of his own life . . . and consequently of doing anything which in his own judgment and reason he shall conceive to be the aptest means thereunto." This liberty or natural right belongs to man only in a state of nature. When men leave the state of nature and enter the commonwealth, they surrender this natural liberty in exchange for a civil liberty which, according to Hobbes, consists in nothing more than their freedom to do what the law of the

state does not prohibit, or to omit doing what the law does not command.

Locke agrees that man's natural liberty is not the freedom of his will in choosing, but the freedom to do what he wills without constraint or impediment. He differs from Hobbes, however, in his conception of natural liberty because he differs in his conception of the state of nature.

For Hobbes the state of nature is a state of war; the notions of right and wrong, justice and injustice, can have no place in it. "Where there is no common power, there is no law: where no law, no injustice." The liberty which sovereign states now have is the same as "that which every man should have if there were no civil laws, nor commonwealth at all. And the effects of it also are the same. For as amongst masterless men, there is perpetual war of every man against his neighbor . . . so in states and commonwealths not dependent on one another, every commonwealth has an absolute liberty to do what it shall judge . . . most conducing to its benefit."

For Locke the state of nature is not a state of war, but a natural as opposed to a civil society, that is, a society in which men live together under natural rather than under civil law. Men who live in this condition are "in a state of perfect freedom to order their actions and dispose of their possessions as they think fit, within the bounds of the law of nature." This is a limited, not an absolute freedom; or, as Locke says, "though this be a state of liberty, yet it is not a state of license." The line between liberty and license is drawn by the precepts of the natural law. The difference, then, between natural and civil liberty lies in this. Natural liberty consists in being "free from any superior power on earth," or not being "under the will or legislative authority of man." Only the rules of natural law limit freedom of action. Civil liberty, or liberty under civil law, consists in being "under no other legislative power but that established by consent." It is a freedom for the individual to follow his own will in all matters not prescribed by the law of the state.

IN THE ARGUMENTS for and against free will, one view regards free will as incompatible with the principle of causality, natural necessity, or

God's omnipotence; the other conceives free choice as falling within the order of nature or causality and under God's providence. We shall not consider these alternatives in this chapter, since this issue is reserved for the chapter on WILL.

Yet one thing is clear for the present consideration of political liberty. If the statement that men are born free means that it is a property of their rational natures to possess a free will, then they do not lose their innate freedom when they live in civil society. Government may interfere with a man's actions, but it cannot coerce his will. Government can go no further than to regulate the expression of man's freedom in external actions.

Nor is the range of free will limited by law. As indicated in the chapter on LAW, any law—moral or civil, natural or positive—which directs human conduct can be violated. It leaves man free to disobey it and take the consequences. But if the rule is good or just, then the act which transgresses it must have the opposite quality. The freedom of a free will is therefore morally indifferent. It can be exercised to do either good or evil. We use our freedom properly, says Augustine, when we act virtuously; we misuse it when we choose to act viciously. "The will," he writes, "is then truly free, when it is not the slave of vices and sins."

Those who conceive the natural moral law as stating the precepts of virtue or the commands of duty and who, in addition, regard every concrete act which proceeds from a free choice of the will as either good or bad—never indifferent—find that the distinction between liberty and license applies to every free act. The meaning of this distinction is the same as that between freedom properly used and freedom misused. Furthermore, since there is no good act which is not prescribed by the moral law, the whole of liberty, as opposed to license, consists in doing what that moral law commands.

These considerations affect the problem of political liberty, especially on the question whether the spheres of law and liberty are separate, or even opposed. One view, as we have seen, is that the area of civil liberty lies outside the realm of acts regulated by law. To break the law may be criminal license, but to

obey it is not to be free. The sphere of liberty increases as the scope or stringency of law diminishes.

The opposite view does not regard freedom as freedom *from* law. "Freedom," Hegel maintains, "is nothing but the recognition and adoption of such universal substantial objects as Right and Law." All that matters in the relation between liberty and law is whether the law is just and whether a man is virtuous. If the law is just, then it does not *compel* a just man to do what he would not *freely* elect to do even if the law did not exist. Only the criminal is coerced or restrained by good laws. To say that such impediment to action destroys freedom would be to deny the distinction between liberty and license.

Nevertheless, liberty can be abridged by law. That is precisely the problem of the good man living under unjust laws. If, as Montesquieu says, "liberty can consist only in the power of doing what we ought to will, and in not being constrained to do what we ought not to will," then governments and laws interfere with liberty when they command or prohibit acts contrary to the free choice of a good man.

The conception of freedom as the condition of those who are rightly governed—who are commanded to do only what they would do anyway—seems to be analogically present in Spinoza's theory of human bondage and human freedom. It is there accompanied by a denial of the will's freedom of choice.

According to Spinoza human action is causally determined by one of two factors in man's nature—the passions or reason. When man is governed by his passions, he is in "bondage, for a man under their control is not his own master, but is mastered by fortune, in whose power he is, so that he is often forced to follow the worse, although he sees the better before him." When man is governed by reason he is free, for he "does the will of no one but himself, and does those things only which he knows are of greatest importance in life, and which he therefore desires above all things." The man who acts under the influence of the passions acts in terms of inadequate ideas and in the shadow of error or ignorance. When reason rules, man acts with adequate knowledge and in the light of truth.

So, too, in the theory of Augustine and

Aquinas, the virtuous man is morally or spiritually free because human reason has triumphed in its conflict with the passions to influence the free judgment of his will. The rule of reason does not annul the will's freedom. Nor is the will less free when it is moved by the promptings of the passions. "A passion," writes Aquinas, "cannot draw or move the will directly." It does so indirectly, as, for example, "when those who are in some kind of passion do not easily turn their imagination away from the object of their affections." But though the will is not altered in its freedom by whether reason or emotion dominates, the situation is not the same with the human person as a whole. The theologians see him as a moral agent and a spiritual being who gains or loses freedom according as the will submits to the guidance of reason or follows the passions.

On the supernatural level, the theologians teach that God's grace assists reason to conform human acts to the divine law, but also that grace does not abolish free choice on the part of the will. "The first freedom of the will," Augustine says, "which man received when he was created upright, consisted in an ability not to sin, but also in an ability to sin." So long as man lives on earth, he remains free to sin. But supernatural grace, added to nature, raises man to a higher level of spiritual freedom than he can ever achieve by the discipline of the acquired virtues.

Still higher is the ultimate freedom of beatitude itself. Augustine calls this "the last freedom of will" which, by the gift of God, leaves man "not able to sin." It is worth noting that this ultimate liberty consists in freedom from choice or the need to choose, not in freedom from love or law. Man cannot be more free than when he succeeds, with God's help, in submitting himself through love to the rule of God.

THE POLITICAL significance of these moral and theological doctrines of freedom would seem to be that man *can be* as free in civil society as in a state of nature. Whether in fact he *is* depends upon the justice of the laws which govern him, not upon their number or the matters with which they deal. He is, of course, not free to do whatever he pleases regardless of the well-being of other men or the welfare of the community,

but that, in the moral conception of liberty, is not a loss of freedom. He loses freedom in society only when he is mistreated or misgoverned—when, being the equal of other men, he is not treated as their equal; or when, being capable of ruling himself, he is denied a voice in his own government.

The meaning of tyranny and slavery seems to confirm this conception of political liberty. To be a slave is not merely to be ruled by another; it consists in being subject to the mastery of another, *i.e.*, to be ruled as a means to that other's good and without any voice in one's own government. This implies, in contrast, that to be ruled as a free man is to be ruled for one's own good and with some degree of participation in the government under which one lives.

According to Aristotle's doctrine of the natural slave—examined in the chapter on SLAVERY—some men do not have the nature of free men, and so should not be governed as free men. Men who are by nature slaves are not unjustly treated when they are enslaved. "It is better for them as for all inferiors," Aristotle maintains, "that they should be under the rule of a master." Though they do not in fact have the liberty of free men, they are not deprived thereby of any freedom which properly belongs to them, any more than a man who is justly imprisoned is deprived of a freedom which is no longer his by right.

The root of this distinction between free men and slaves by nature lies in the supposition of a natural inequality. The principle of equality is also relevant to the injustice of tyranny and the difference between absolute and constitutional government. In the *Republic* Plato compares the tyrant to an owner of slaves. "The only difference," he writes, "is that the tyrant has more slaves" and enforces "the harshest and bitterest form of slavery." The tyrannical ruler enslaves those who are his equals by nature and who should be ruled as free men. Throughout the whole tradition of political thought the name of tyranny signifies the abolition of liberty. But absolute or despotic government is not uniformly regarded as the enemy of liberty.

The issue concerning the legitimacy or justice of absolute government is examined in the chapters on MONARCHY and TYRANNY. But we

can take it as generally agreed that the subjects of a despot, unlike the citizens of a republic, do not enjoy any measure of self-government. To the extent that political liberty consists in some degree of self-government, the subjects of absolute rule lack the sort of freedom possessed by citizens under constitutional government. For this reason the supremacy of law is frequently said to be the basic principle of political liberty.

"Wherever law ends, tyranny begins," Locke writes. In going beyond the law, a ruler goes beyond the grant of authority vested in him by the consent of the people, which alone makes man "subject to the laws of any government." Furthermore, law for Locke is itself a principle of freedom. "In its true notion," he writes, it "is not so much the limitation as the direction of a free and intelligent agent to his proper interest, and prescribes no farther than is for the general good of those under that law. Could they be happier without it, the law, as a useless thing, would of itself vanish, and that ill deserves the name of confinement which hedges us in only from bogs and precipices. So that however it may be mistaken, the end of law is not to abolish or restrain, but to preserve and enlarge freedom."

A constitution gives the ruled the status of citizenship and a share in their own government. It may also give them legal means with which to defend their liberties when officers of government invade their rights in violation of the constitution. According to Montesquieu, for whom political liberty exists only under government by law, never under despotism or the rule of men, the freedom of government itself demands "from the very nature of things that power should be a check to power." This is accomplished by a separation of powers. A system of checks and balances limits the power of each branch of the government and permits the law of the constitution to be applied by one department against another when its officials usurp powers not granted by the constitution or otherwise act unconstitutionally.

Yet, unlike tyranny, absolute government has been defended. The ancients raise the question whether, if a truly superior or almost god-like man existed, it would not be proper for him to govern his inferiors in an absolute man-

ner. "Mankind will not say that such a one is to be expelled and exiled," Aristotle writes; "on the other hand, he ought not to be a subject—that would be as if mankind should claim to rule over Zeus, dividing his offices among them. The only alternative," he concludes, "is that all should joyfully obey such a ruler, according to what seems to be the order of nature, and that men like him should be kings in their state for life." Those subject to his government would be free only in the sense that they would be ruled for their own good, perhaps better than they could rule themselves. But they would lose that portion of political freedom which consists in self-government. Faced with this alternative to constitutional government—which Aristotle describes as the government of free men and equals—what should be the choice of men who are by nature free?

THE ANCIENT ANSWER is not decisively in one direction. There are many passages in both Plato and Aristotle in which the absolute rule of a wise king (superior to his subjects as a father is to children, or a god to men) seems to be pictured as the political ideal. The fact that free men would be no freer than children in a well administered household does not seem to Plato and Aristotle to be a flaw in the picture. They do not seem to hold that the fullness of liberty is the primary measure of the goodness of government.

On the contrary, justice is more important. As Aristotle suggests, it would be unjust for the superior man to be treated as an equal and given the status of one self-governing citizen among others. But he also points out that "democratic states have instituted ostracism" as a means of dealing with such superior men. "Equality is above all things their aim, and therefore they ostracized and banished from the city for a time those who seemed to predominate too much." Because it saves the superior man from injustice and leaves the rest free to practice self-government, "the argument for ostracism," Aristotle claims, "is based upon a kind of political justice," in that it preserves the balance within the state, and perhaps also because it leaves men free to practice self-government among themselves.

Since the eighteenth century, a strong tend-

ency in the opposite direction appears in the political thought of Locke, Montesquieu, Rousseau, Kant, the American constitutionalists, and J. S. Mill. Self-government is regarded as the essence of good government. It is certainly the mark of what the eighteenth century writers call "free government." Men who are born to be free, it is thought, cannot be satisfied with less civil liberty than this.

"Freedom," says Kant, "is independence of the compulsory will of another; and in so far as it can co-exist with the freedom of all according to a universal law, it is the one sole, original inborn right belonging to every man in virtue of his humanity. There is, indeed, an innate equality belonging to every man which consists in his right to be independent of being bound by others to anything more than that to which he may also reciprocally bind them." The fundamental equality of men thus appears to be founded in their equal right to freedom; and that, for Kant at least, rests on the freedom of will with which all men are born. The criterion of the good society is the realization of freedom.

Kant's conception of human society as a realm of ends, in which no free person should be degraded to the ignominy of being a means, expresses one aspect of political freedom. The other is found in his principle of the harmonization of individual wills which results in the freedom of each being consistent with the freedom of all. In institutional terms, republican government, founded on popular sovereignty and with a system of representation, is the political ideal precisely because it gives its citizens the dignity of free men and enables them to realize their freedom in self-government.

Citizenship, according to Kant, has three inseparable attributes: "1. constitutional freedom, as the right of every citizen to have to obey no other law than that to which he has given his consent or approval; 2. civil equality, as the right of the citizen to recognize no one as a superior among the people in relation to himself, except in so far as such a one is as subject to *his* moral power to impose obligations, as that other has power to impose obligations upon him; and 3. political independence, as the right to owe his existence and continuance in society not to the arbitrary will of another;

but to his own rights and powers as a member of the commonwealth, and, consequently, the possession of a civil personality, which cannot be represented by any other than himself."

Kant leans heavily on Rousseau's conclusions with regard to political liberty. Rousseau, however, approaches the problem of freedom somewhat differently. "Man is born free," he begins, "and everywhere he is in chains." He next considers two questions. What makes government legitimate, "since no man has a natural authority over his fellow, and force creates no right"? Answering this first question in terms of a convention freely entered into, Rousseau then poses the second problem—how to form an association "in which each, while uniting himself with all, may still obey himself alone, and remain as free as before." This, he says, is "the fundamental problem of which the *Social Contract* provides the solution."

The solution involves more than republican government, popular sovereignty, and a participation of the individual through voting and representation. It introduces the conception of the general will, through which alone the freedom of each individual is to be ultimately preserved. Like Kant's universal law of freedom, the general will ordains what each man would freely will for himself if he adequately conceived the conditions of his freedom. "In fact," says Rousseau, "each individual, as a man, may have a particular will contrary or dissimilar to the general will which he has as a citizen. His particular interest may speak to him quite differently from the common interest." Nevertheless, under conditions of majority rule, the members of the minority remain free even though they appear to be ruled against their particular wills.

When a measure is submitted to the people, the question is "whether it is in conformity with the general will, which is their will. Each man, in giving his vote, states his opinion on that point; and the general will is found by counting votes. When, therefore, the opinion that is contrary to my own prevails, this proves neither more nor less than that I was mistaken, and that what I thought to be the general will was not so. If my particular opinion had carried the day, I should have achieved the opposite of what was my will; and it is in that case

that I should not have been free. This presupposes, indeed, that all the qualities of the general will still reside in the majority; when they cease to do so, whatever side a man may take, liberty is no longer possible."

J. S. MILL SEES THE same problem from the opposite side. Constitutional government and representative institutions are indispensable conditions of political liberty. Where Aristotle regards democracy as the type of constitution most favorable to freedom because it gives the equality of citizenship to all *free-born* men, Mill argues for universal suffrage to give equal freedom to *all* men, for all are born equal. But neither representative government nor democratic suffrage is sufficient to guarantee the liberty of the individual and his freedom of thought or action.

Such phrases as "self-government" and "the power of the people over themselves" are deceptive. "The 'people' who exercise the power," Mill writes, "are not always the same people with those over whom it is exercised; and the 'self-government' spoken of is not the government of each by himself, but of each by all the rest. The will of the people, moreover, practically means the will of the most numerous or the most active part of the people; the majority, or those who succeed in making themselves accepted as the majority."

To safeguard individual liberty from the tyranny of the majority, Mill proposes a single criterion for social control over the individual, whether by the physical force of law or the moral force of public opinion. "The sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of their number, is self-protection. . . . The only part of the conduct of anyone, for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign."

Mill's conception of individual liberty at first appears to be negative—to be freedom *from* externally imposed regulations or coercions. Liberty increases as the sphere of government diminishes; and, for the sake of liberty, that government governs best which governs

least, or governs no more than is necessary for the public safety. "There is a sphere of action," Mill writes, "in which society, as distinguished from the individual, has, if any, only an indirect interest; comprehending all that portion of a person's life and conduct which affects only himself, or if it also affects others, only with their free, voluntary, and undeceived consent and participation. When I say only himself," Mill continues, "I mean directly and in the first instance; for whatever affects himself, may affect others through himself. . . . This, then, is the appropriate region of human liberty."

But it is the positive aspect of freedom from governmental interference or social pressures on which Mill wishes to place emphasis. Freedom *from* government or social coercion is freedom *for* the maximum development of individuality—freedom to be as different from all others as one's personal inclinations, talents, and tastes dispose one and enable one to be.

"It is desirable," Mill writes, "that in things which do not primarily concern others, individuality should assert itself." Liberty is undervalued as long as the free development of individuality is not regarded as one of the principal ingredients of human happiness and indispensable to the welfare of society. "The only freedom which deserves the name," Mill thinks, "is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it"; for, "in proportion to the development of his individuality, each person becomes

more valuable to himself, and is therefore capable of being more valuable to others. There is a greater fullness of life about his own existence, and when there is more life in the units there is more in the mass which is composed of them."

Mill's praise of liberty as an ultimate good, both for the individual and for the state, finds a clearly antiphonal voice in the tradition of the great books. Plato, in the *Republic*, advocates political regulation of the arts, where Mill, even more than Milton before him, argues against censorship or any control of the avenues of human expression. But the most striking opposition to Mill occurs in those passages in which Socrates deprecates the spirit of democracy because of its insatiable desire for freedom. That spirit, Socrates says, creates a city "full of freedom and frankness, in which a man may do and say what he likes . . . Where such freedom exists, the individual is clearly able to order for himself his own life as he pleases."

The democratic state is described by Socrates as approaching anarchy through relaxation of the laws or through utter lawlessness. Under such circumstances there will be the greatest variety of individual differences. It will seem "the fairest of states, being like an embroidered robe which is spangled with every sort of flower." But it is a state in which liberty has been allowed to grow without limit at the expense of justice and order. It is "full of variety and disorder, and dispensing a sort of equality to equals and unequals alike."

OUTLINE OF TOPICS

	PAGE
1. Natural freedom and political liberty	1001
1a. The birthright of freedom	
1b. The independence of men and the autonomy of sovereigns in a state of nature or anarchy	
1c. The relation of liberty to free will: the conceptions of liberty as freedom from interference and freedom for personal development	1002
1d. The supremacy of law as a condition of political liberty	
1e. The restriction of freedom by justice: the distinction between liberty and license	
1f. The freedom of equals under government: the equality of citizenship	
1g. The juridical protection of liberties: bills of rights; the separation of powers	1003
1h. Civil liberty under diverse forms of government	

	PAGE
2. The issues of civil liberty	1003
2a. Freedom of thought and expression: the problem of censorship	
2b. Liberty of conscience and religious freedom	1004
2c. Freedom in the sphere of economic enterprise: free trade; freedom from governmental restrictions	1005
2d. Economic dependence as a limitation of civil liberty: economic slavery or subjection	
3. Moral or spiritual freedom	
3a. Human bondage, or the dominance of the passions	
3b. Human freedom or the rule of reason: freedom through knowledge of the truth	1006
3c. Virtue as the discipline of free choice: freedom as the determination of the will by the moral law of practical reason	
3d. Freedom from conflict and freedom for individuality as conditions of happiness	1007
4. The metaphysics of freedom	
4a. The relation of human liberty to chance and contingency	
4b. The opposites of freedom: causality or necessity, nature, and law	
5. The theology of freedom	1008
5a. Man's freedom in relation to fate or to the will of God	
5b. Man's freedom and God's knowledge	1009
5c. Man's freedom and God's grace: the freedom of the children of God	
5d. The divine freedom: the independence or autonomy of infinite being; divine choice	
6. Liberty in history	1010
6a. The historical significance of freedom: stages in the realization of freedom; the beginning and end of the historical process	
6b. The struggle for civil liberty and economic freedom: the overthrow of tyrants, despots, and oppressors	
6c. The struggle for sovereign independence against the yoke of imperialism or colonial subjugation	1011

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 48: LIFE AND DEATH

INTRODUCTION

MEN have divided the totality of things in various ways. The three most fundamental divisions rest on the distinction between the natural and the supernatural, between the material and the spiritual, and between the lifeless and the living.

The same kind of basic question is raised by each of these divisions, and given opposite answers in the tradition of the great books. The question is not always formulated in the same way. It may be a question about the existence of the supernatural order or of incorporeal beings. It may be a problem of whether the terms of the division represent a real duality or merely different aspects of one and the same whole. Are God and nature one or are they radically distinct? Is spirituality merely one expression of bodily existence, or are there two worlds, a world of bodies and a world of spirits?

These issues are considered in the chapters on GOD, NATURE, ANGEL, and MATTER, as well as in the chapter on BEING. The issue raised by the third great division is one of the central topics in this chapter. That issue concerns the difference between the living and the non-living. There is no question here about whether, in the order of nature, living things exist. The fact of life is not denied, at least not as a matter of observation. On the surface there certainly appears to be a striking difference between the living tree and the stone, or between the animal which a moment ago was alive and is now dead.

But how this difference is to be understood is the question. Does it signify an absolute break, a discontinuity, between the world of living bodies and the domain of inanimate things? Or is the continuity of nature preserved across the line which divides inorganic and organic matter? Is the difference between the

non-living and the living (or the living and the dead) one of kind or of degree?

Those who answer that it is a difference in kind usually formulate a definition of life which draws a sharp line, on one side of which are the things that have the indispensable properties of life, while on the other side are things totally lacking in these properties. The critical point here turns on whether vitality is present in some degree or totally absent. The definition of life may not always be the same. It may not always, for example, postulate the soul as the principle in all living things, or involve the same conception of soul in relation to living organisms. But when life is defined as an essential characteristic of some natures, the definition implies the existence of natures which are totally lacking in the properties essential to life. It also implies the impossibility of intermediate links between the lowest form of life and the most complex of the inorganic substances.

The opposite answer that there is only a difference in degree between the inanimate and the animate, affirms the continuity of nature across the gap between things which appear lifeless and those which seem to be alive. All bodies have the same fundamental properties, though not in the same magnitude. But here there is a further question. It can be asked whether those properties are the powers or functions commonly associated with the appearance of being alive, such as growth, reproduction, sensitivity, desire, locomotion; or whether they are the mechanical properties of matter in motion—properties which vary only with the degrees of complexity in the organization of matter.

According to the doctrine which is sometimes called "animism" and sometimes "panpsychism," everything is alive, every body is besouled, though at the lower end of the scale the

signs of vitality remain hidden from ordinary observation. Although this theory is usually attributed to a primitive view of nature, it appears in a subtle form in certain philosophical developments which make soul or mind a principle as universal as matter. "There is one common substance," says Marcus Aurelius, "though it is distributed among countless bodies which have their several qualities. There is one soul, though it is distributed among infinite natures and individual circumscriptions."

The doctrine which in modern times is called "mechanism" conceives the continuity of nature in terms of the universality of purely mechanical principles. It reduces all phenomena to the interaction of moving parts or particles. No new principle is needed to explain the phenomena of life. The laws of physics and chemistry suffice. Biophysics and biochemistry simply deal with the mechanics of more complex material systems. The apparent differences in function between "living" and "non-living" things represent the same functions. They are altered only in *appearance* by the more complex organization of the matter which is called "living."

THE CONTROVERSY over mechanistic principles in the analysis of life arose with great explicitness in the latter part of the nineteenth century and continues to our own day. The chief opponents of the mechanists are those who at one time called themselves "vitalists" to signify their insistence upon an essential difference between vital and mechanical phenomena. The work of Jacques Loeb can be taken to represent the mechanistic side of this controversy; the writings of Bergson, Haldane, Whitehead, the vitalist position.

Those who regard the realm of living things as a distinct domain in nature also think that the study of living things has special concepts, principles, and methods as different from those of physics and chemistry as the objects studied are distinct.

Biology is a science of ancient origin. The Hippocratic collection of writings on health and disease, the extensive biological researches of Aristotle, the work of Galen, represent more than a bare beginning of the science. The ancient classification of vital functions establishes

the terms of biological analysis. Ideas which have come to seem obvious because of traditional acceptance were once great discoveries; for example, that all living bodies nourish themselves, grow, and reproduce; that these are the minimal, not the maximal, functions of organic matter; that there is a regular cycle of growth and decay in the normal life span which is itself different for different types of organisms; that in the dynamic equilibrium between the living organism and its physical environment, the organism actively maintains itself through a certain balance of exchanges in the biological economy, of which breathing is a prime example.

The great books of biological science from Aristotle to Harvey seem to be of one mind on the point that living matter possesses distinctive powers and performs functions which are not present in *any degree* in the realm of the inert or inorganic. For the most part they reflect the theory that the living body possesses a soul which is the principle of its vitality and the source of the vital powers embodied in its various organs.

In ancient and mediaeval theory, the soul is not conceived as belonging peculiarly to man; it is not identified with mind or with the intellectual faculties. The word "animal" derives from the Latin name for soul—the principle of animation. It is true that Galen distinguishes between what he calls the "natural" and the "psychic" faculties. The latter for him are the powers of sensitivity, desire, and locomotion. Yet his analysis of the vegetative powers of nutrition, growth, and reproduction which are common to plants and animals squares with Aristotle's conception of the vegetative soul.

"What has soul in it," Aristotle writes, "differs from what has not, in that the former displays life. Now this word has more than one sense. . . . Living, that is, may mean thinking or perception or local movement and rest, or movement in the sense of nutrition, decay, and growth. Hence we think of plants also as living, for they are observed to possess in themselves an originative power through which they increase and decrease in all spatial directions. This power of self-nutrition . . . is the originative power, the possession of which leads us to speak of things as *living*."

IN THE GREAT BOOKS the opposite position with respect to the living and non-living seems to appear for the first time with Descartes. It might be supposed that Lucretius, since he denies the soul as an immaterial principle, would also tend to reject anything except a difference in degree between animate and inanimate bodies. But this is not the case. According to Lucretius living things are not merely more complex combinations of atoms and void. Their constitution includes a special type of soul-atom, whose round, smooth shape and speed of movement through all parts of the living body accounts for the powers and activities which are peculiar to that body. Lucretius is recognized as a materialist and a mechanist, yet he sharply separates living from non-living bodies and appeals to a special principle—the soul-atom—to explain this difference in kind.

As appears in the chapters on MIND and SOUL, Descartes is at variance not only with Lucretius but also with Aristotle, Galen, and Plotinus in his conception of the soul and of life. The soul is not a body or composed of bodies. Neither, in his opinion, is it an immaterial principle conjoined with organic matter to constitute the living body. It is itself an immaterial substance, quite separate from the human body to which it is allied.

Descartes tells us how he passed from "a description of inanimate bodies and plants . . . to that of animals, and particularly to that of men." He asks us to consider the supposition that "God formed the body of man altogether like one of ours . . . without making use of any matter other than that which I have described and without at first placing in it a rational soul or any other thing which might serve as a vegetative or sensitive soul." He then goes on to say that "examining the functions which might in accordance with this supposition exist in this body, I found precisely all those which might exist in us without our having the power of thought, and consequently without our soul—that is to say, this part of us, distinct from the body, of which it has been said that its nature is to think."

The mechanistic implications of his supposition are explicitly developed by Descartes in his consideration of Harvey's discovery of the motions of the heart and blood. These move-

ments, he says, follow "as necessarily from the very disposition of the organs . . . as does that of a clock from the power, the situation, and the form, of its counterpoise and of its wheels." In these motions, as well as in the actions of the nerves, brain, and muscles, it is not necessary to suppose any other cause than those operating according "to the laws of Mechanics which are identical with those of nature."

This will not seem strange, Descartes adds, to those who know "how many different automata or moving machines can be made by the industry of man, without employing in so doing more than a very few parts in comparison with the great multitude of bones, muscles, nerves, arteries, veins or other parts that are found in the body of each animal. From this aspect, the body is regarded as a machine, which, having been made by the hands of God, is incomparably better arranged, and possesses in itself movements which are much more admirable, than any of those which can be invented by man." Only the functions of reason, only the acts of thinking—not those of living—operate under other than the mechanical laws of corporeal nature. Whether living or not, all bodies without reason or a rational soul are automata or machines. Whatever they do can be explained as a kind of clockwork—by the disposition and interaction of their parts.

ANOTHER SOURCE and another version of the view that the continuity of nature is uninterrupted, comes from the theory of evolution. Darwin himself, in his brief consideration of the origin of life, deals mainly with the alternative hypotheses of the divine creation of a *single* original form or of *several* primitive forms from which the whole of the plant and animal kingdoms has developed by the natural steps of evolution. He rejects the division of the animate world into more than the two great kingdoms of plant and animal life, and holds that man differs from other animals only in degree, not in kind.

As indicated in the chapters on ANIMAL and EVOLUTION, Darwin questions the discontinuity between plants and animals. He refers to the intermediate forms which seem to belong to both kingdoms. He suggests the possibility that the lowest forms of animal life may have

developed by natural evolutionary descent from plant organisms. But he does not *seriously* consider the hypothesis of an evolutionary transition from inorganic matter to living organisms. Here, on the contrary, he seems to recognize a difference in kind. "The most humble organism," he writes, "is something much higher than the inorganic dust under our feet; and no one with an unbiased mind can study any living creature, however humble, without being struck with enthusiasm at its marvellous structure and properties." He questions the notion that living organisms might have originated from inorganic matter by spontaneous generation. "Science has not as yet proved the truth of this belief," he says, "whatever the future may reveal."

Nevertheless, with the extension of Darwin's theory of the origin of species into a doctrine of cosmic evolution, what James calls "the evolutionary afflatus" leads writers like Tyndall and Spencer to "talk as if mind grew out of body in a continuous way. . . . So strong a postulate is continuity," James writes, that the evolutionists try to "leap over the breach" between inorganic matter and consciousness.

"In a general theory of evolution," he explains, "the inorganic comes first, then the lowest forms of animal and vegetable life, then forms of life that possess mentality, and finally those like ourselves that possess it in a high degree. . . . We are dealing all the time with matter and its aggregations and separations; and although our treatment must perforce be hypothetical, this does not prevent it from being *continuous*. The point which as evolutionists we are bound to hold fast is that all the new forms of being that make their appearance are nothing more than results of the redistribution of the original and unchanging materials. The self-same atoms which, chaotically dispersed, made the nebula, now, jammed and temporarily caught in peculiar position, form our brains; and the 'evolution' of the brains, if understood, would be simply the account of how the atoms came to be so caught and jammed. In this story no new *natures*, no factors not present at the beginning, are introduced at any later stage."

James is here presenting a theory which he himself rejects. He recognizes the strength of the "postulate of continuity" in the theories of

Spencer, Tyndall, and other evolutionists, but he thinks the evident "contrasts between living and inanimate performances" favor the division of nature into two realms. Yet he also seems to regard some degree of intelligence or mentality as an accompaniment of life. Hence his criterion of the difference in kind "between an intelligent and a mechanical performance"—namely, purposiveness or "the pursuance of future ends and the choice of means"—also serves as the mark of distinction between the animate and the inanimate.

IT IS WORTH remarking that this criterion is one of the tests Descartes proposes for differentiating man from all the rest of nature, man alone having reason or thought. It is also worth noting that in associating different degrees of mentality or consciousness with life at all levels of development, James himself affirms a continuity in the realm of all living things. He therefore does not go as far in the direction of discontinuity as do those in the tradition of the great books who find an essential difference between the inanimate and the living, between plant and animal, and between brute and human life.

The issues raised by these last two distinctions are further considered in the chapters on ANIMAL, MAN, and MIND. Here we are concerned only with the fact that those who find genuine differences in kind in the world of animate things also tend to distinguish between the living and the non-living by reference to the most generic properties of corporeal life, that is, the powers or functions shared by plants, animals, and men. The question of origins does not seem to be relevant to the problem of differences. Aquinas, for example, does not seem to regard the hypothesis of the spontaneous generation of living organisms from putrefying organic matter as inconsistent with his assertion that the vegetative functions of plants and animals are not performed—in *any degree*—by inanimate bodies.

When Aristotle says of natural bodies that "some have life in them, others not; and by life we mean self-nutrition and growth," he is aware that the word "growth" occurs in the description of a certain type of change in inanimate bodies. Other than living things increase in

size. To avoid an equivocal use of the word "growth," he assigns three distinguishing characteristics to the quantitative change or increase in living things: "(1) Any and every part of the growing magnitude is made bigger, (2) by the accession of something, and (3) in such a way that the growing thing is preserved and persists."

To exemplify this difference, Galen compares the growth of an organism with the expansion of a dried bladder when children blow air into it. The expanding bladder seems to grow, but not as it did when it was a part of a living animal and when the growth of the whole involved the growth of each part. "In these doings of the children," Galen writes, "the more the interior cavity of the bladder increases in size, the thinner, necessarily, does its substance become. But, if the children were able to bring nourishment to this thin part, then they would make the bladder big in the same way that Nature does. . . . To be distended in all directions belongs only to bodies whose growth is directed by Nature; for those which are distended by us undergo this distension in one direction but grow less in the others; it is impossible to find a body which will remain entire and not be torn through whilst we stretch it in the three dimensions. Thus Nature alone has the power to expand a body in all directions so that it remains unruptured and preserves completely its previous form."

Modern biologists sometimes compare the growth of crystals in solution with living growth and reproduction. Or, making the point that "other systems in dynamic equilibrium show in essence all the properties of living things," they say that "it is almost impossible to distinguish a candle flame from a living organism." Aristotle considers the latter comparison and rejects it. He observes that "the growth of fire goes on without limit so long as there is a supply of fuel"; but no amount of nutriment can increase the size of living things without limit. "There is a limit or ratio which determines their size and increase, and the limit and ratio are marks of the soul, but not of fire."

The flame is a lively thing, but to say that it is alive, that it grows or dies, is in Aristotle's view a poetic metaphor, not a scientific statement. "When I have plucked the rose," Othello says, "I cannot give it vital growth again, it

needs must wither." But to the candle burning beside Desdemona's bed, he says: "If I quench thee, thou flaming minister, I can again thy former light restore." The flame is lit or extinguished by motions from without; but the birth and death, the nourishing and growth of the living thing is self-movement.

According to Aristotle and Aquinas self-movement is the essential mark of being alive. "All things are said to be alive," Aquinas writes, "which determine themselves to movement or operation of any kind; whereas those things which cannot by their own nature do so, cannot be called living except by a similitude." He further defines the meaning of self-movement by distinguishing between the *transitive* action of one inert body upon another and the *immanent* activity of a living thing, whereby the agent itself is perfected. Growing, sensing, and understanding are immanent actions because they are activities which affect the growing, sensing, or understanding thing. The result of such actions *remains in the agent*. In contrast, heating is a transitive action. In heating, one thing acts upon another, and the hot thing loses its own heat in the process.

As vital operations differ thus from the actions of inanimate bodies, so do vital powers differ from the capacities of inert matter, through which bodies can act upon or react to other bodies. The power of self-movement (or immanent activity) enables living things alone to change from a less perfect to a more perfect state of being, as measured by the thing's nature, rather than simply to change from contrary to contrary, as a body changes when it moves locally from this place to that, or alters from hot to cold, or cold to hot.

FOR THE THEOLOGIAN, there is an additional aspect to the problem of defining life. If the realm of corporeal substances is divided into inert and living bodies, what is to be said about incorporeal substances (*i.e.*, the angels) and about God? It is easier to think of the angels as *not being* than to conceive them as *not being alive*. More than "infinite" or "omnipotent" or "eternal," "the ever-living God" is the phrase which, in the language of religious worship, expresses positively the divine nature. But the fundamental activities which distinguish living from

non-living bodies (such as nutrition, growth, reproduction) are essentially corporeal in nature. So, too, are sensing and locomotion. What common meaning of life, then, can apply to material and spiritual beings?

Aquinas answers by saying that "since a thing is said to live in so far as it operates of itself and not as moved by another, the more perfectly this power is found in anything, the more perfect is the life of that thing." By this criterion, plants are less perfectly alive than animals, in whom self-movement is found to a higher degree because of their sensitive faculties; and among animals, there are grades of life according to degrees of sensitivity, and according to the possession of mobility, a power which certain animals seem to lack. In both the higher animals and in man, there is purposive behavior, but man alone, through his intellect and will, can freely determine his own ends and choose the means to them; hence these faculties give human life an even greater degree of self-movement.

But the action of the human intellect is not perfectly self-determined, for it depends in part upon external causes. Wherefore Aquinas concludes that life in the highest degree belongs properly to God—"that being whose act of understanding is its very nature and which, in what it naturally possesses, is not determined by another." He quotes Aristotle's remark that the perfection of God's life is proportionate to the perfection of the divine intellect, which is purely actual and eternally in act. And he goes on to remark that, in the sense in which understanding is movement, and that which understands itself moves itself, "Plato also taught that God moves Himself."

Nourishment, growth, and reproduction are indispensable features of corporeal life precisely because corporeal things are perishable. They need "reproduction to preserve the species," Aquinas writes, "and nourishment to preserve the individual." Hence the higher powers of life, such as sensing and understanding, are never found in corporeal things apart from the vegetative powers. This does not hold, however, for spiritual beings which are by nature imperishable. Spiritual life is essentially immortal life.

Subject to the ravages of time, corporeal life at every moment betrays its mortality—in its need for sleep, in the enfeeblement of its pow-

ers, in disease, decay, or degeneration. Death is the correlative of life for those who sharply divide the living from the non-living. Rocks may crumble into dust, bodies may disintegrate, and atoms explode—but they do not die. Death is a change which only living matter undergoes.

The transition from life to death accentuates the mystery of life. The notion of spontaneous generation aside, life always seems to come from life. Whether by cell division or by germination, the living thing that is generated comes from the living substance of another thing. But when a living thing dies, it crosses the gap between the living and the non-living. As the organic matter of the corpse decomposes, nothing is left but the familiar inorganic elements and compounds. This seems to be a change more radical than generation or birth. All the metaphysical problems of form and substance, of matter and the soul, of continuity and discontinuity in nature, which appear in the analysis of life, become more intense in the understanding of death.

As APPEARS in the chapter on IMMORTALITY, the living are preoccupied with death, not predominantly with analyzing it, but with facing and fearing it, struggling against or embracing it. Death, as the great poems reveal, is the object of soliloquy in moments of greatest introspection or self-appraisal. To die well, Montaigne points out, requires greater moral stamina than to live well. For him the essence of the philosophical temper, as for others the meaning of heroism or martyrdom, consists in facing death with an equanimity which reflects the highest qualities of a well-resolved life.

Montaigne devotes a long essay to the subject that "to philosophise is to learn to die," and begins it by quoting Cicero's statement that "to study philosophy is nothing but to prepare one's self to die." Socrates then is the prototype of the philosopher, for in conversation with his friends in prison while awaiting death, he tells them that "the true votary of philosophy . . . is always pursuing death, and dying." He tries to prove to them, by his actions as well as by his words, that "the real philosopher has reason to be of good cheer when he is about to die."

Not only death but the dead exercise a profound effect upon the living. The historians describe the various forms which the ceremonials

of death take in every society. Whether the rituals are secular or sacred, they are among the most significant customs of any culture, for they reveal the value placed upon life and the conception of life's meaning and man's destiny. No deeper differences exist among the great religions than those which appear in the practices or sacraments in preparation for death and in the services for the dead.

The moral, social, and religious aspects of death appear to be peculiarly human. Yet on the biological level, the same fundamental instincts and emotions seem to prevail in animals and men. The struggle to remain alive may be presumed to occur in plants. But it is not there as plainly discernible as in the specific patterns of behavior manifested by the animal instinct of self-preservation. Almost in proportion to the degree of vitality, the instinct of self-preservation operates with a strength and pertinacity as vigorous as the love for life and arouses as an emotional corollary an equally devouring fear of death.

The instinct of self-preservation is the life instinct. Directed toward the related ends of maintaining and increasing life are the reproductive impulses and the erotic instincts. But, according to Freud, there is in all living matter a more primitive instinct than these, and one which aims in the opposite direction. That is the death instinct—the impulse of the living to return to lifelessness.

"It would be contrary to the conservative nature of instinct," Freud writes, "if the goal of life were a state never hitherto reached. It must rather be an ancient starting point, which the living being left long ago, and to which it harks back again. . . . If we may assume as an experience admitting of no exception that everything dies from causes within itself, and returns to the inorganic, we can only say 'The goal of all life is death.'"

The death instinct, according to Freud, originates with life itself. "At one time or another, by some operation of force which completely baffles conjecture, the properties of life were awakened in lifeless matter. . . . The tension then aroused in the previously inanimate matter strove to attain an equilibrium; the first instinct was present, that to return to lifelessness." The death instinct acts against the tendency of

the erotic instincts, "which are always trying to collect living substances together into ever larger unities. . . . The cooperation and opposition of these two forces produce the phenomena of life to which death puts an end."

Freud's hypothesis of the death instinct has a bearing on the impulse to commit suicide and on the question whether it is natural or perverse for men to choose this escape from the tensions and difficulties of life. The psychological problem here, especially with regard to the unconscious forms of the suicidal impulse, is not the same as the moral problem. The question whether animals other than men ever commit suicide, like the question whether the killing of one animal by another can be called "murder," indicates the difference between psychological description and moral judgment.

FOR THE MORALIST the condemnation of suicide seems to rest on the same grounds as the condemnation of murder. With Kant, for example, it represents the same type of violation of the universal moral law. The categorical imperative requires us to act always as if the maxim of our individual action could be universalized as a rule for all men to follow. But, in the case of suicide as in the case of murder, the maxim of the action cannot be universalized without accomplishing a result which no one intends. Furthermore, suicide is not consistent with the idea of the human person as an end in itself. The man, says Kant, who destroys himself "in order to escape from painful circumstances uses a person merely as a means to maintain a tolerable condition up to the end of life."

Suicide is also condemned by the theologians as a contravention of the divine as well as of the natural law. Men are God's handiwork and, therefore, as Locke puts it, "they are His property . . . made to last during His, not one another's, pleasure." Under the natural law, a man is not at liberty to destroy himself, nor consequently is he at liberty to sell himself into slavery. Everyone "is bound to preserve himself and not quit his station willfully." If, furthermore, there is an after-life of rewards and punishments, suicide is no escape. "Death so snatched," Adam tells Eve in *Paradise Lost*, "will not exempt us from the pain we are by doom to pay."

There is similar reasoning in pagan antiquity. Suicide is an act of violence and, says Plotinus, "if there be a period allotted to all by fate, to anticipate the hour could not be a happy act. . . . If everyone is to hold in the other world a standing determined by the state in which he quitted this, there must be no withdrawal as long as there is any hope of progress." A Christian would add that to relinquish hope as long as life persists is the sin of despair.

But the pagan tradition also speaks with an opposite voice. For the Stoics, suicide does not seem to be as reprehensible as murder. To those who complain of life's pains and the fetters of the body, Epictetus says, "The door is open." In a doctrine in which all things that affect only the body are indifferent to the soul's well-being, death too is indifferent. "Death is the harbor for all; this is the place of refuge; as soon as you choose, you may be out of the house."

OUTLINE OF TOPICS

	PAGE
1. The nature and cause of life: the soul as the principle of life in organic bodies	1021
2. Continuity or discontinuity between living and non-living things: comparison of vital powers and activities with the potentialities and motions of inert bodies	1022
3. The modes or grades of corporeal life: the classification and order of the various vital powers or functions	
3a. Continuity or discontinuity between plants and animals: comparison of plant and animal nutrition, respiration, growth, and reproduction	1023
3b. The grades of animal life: types and degrees of mobility and sensitivity; analogies of structure and function	1024
4. The biological economy: the environment of the organism; the interdependence of plants and animals	
5. Normal vitality and its impairment by disease, degeneration, and enfeeblement with age	1025
5a. The nature and causes of health	
5b. The restorative function of rest or sleep	1026
5c. The nature and causes of disease	
6. The life span and the life cycle	1027
6a. The life span of plants and animals, and of different species of plants and animals	
6b. The human life span	
6c. The biological characteristics of the stages of life	
7. The causes and occurrence of death: the transition from life to death	1028
8. The concern of the living with life and death	1029
8a. The love of life: the instinct of self-preservation; the life instinct	
8b. The desire for death: the death instinct; the problem of suicide	
8c. The contemplation and fear of death: the attitude of the hero, the philosopher, the martyr	1030
8d. The ceremonials of death: the rites of burial in war and peace	1032

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265–283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a–119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b–164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265–283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) II *Esdras* 7:46.

SYMBOLS: The abbreviation “esp” calls the reader’s attention to one or more especially relevant parts of a whole reference; “passim” signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature and cause of life: the soul as the principle of life in organic bodies

OLD TESTAMENT: *Genesis*, 1:20–27; 2:7 / *Job*, 12:9–10

7 PLATO: *Cratylus*, 93c / *Phaedrus*, 124b–d / *Phaedo*, 223c–d; 225b; 244b–246c / *Gorgias*, 275d–277b passim / *Laws*, BK X, 763a–764a

8 ARISTOTLE: *Topics*, BK VI, CH 10 [148^a23–37] 202b–c / *Metaphysics*, BK V, CH 4 [1014^b22–26] 535a; CH 8 [1017^b10–17] 538b; BK VII, CH 10 [1035^b14–28] 559a–b; BK IX, CH 6 [1048^b18–34] 574a–c; BK XII, CH 7 [1072^b14–29] 602d–603a; BK XIII, CH 2 [1077^a20–23] 608c / *Soul*, BK I 631a–641d passim; BK II, CH 1–4 642a–647b; BK III, CH 12–13 667a–668d / *Youth, Life, and Breathing*, CH 1–4 714a–716b; CH 14 720d–721a

Chapter 49: LOGIC

INTRODUCTION

IN this set of great books, the *Organon* of Aristotle, the *Novum Organum* of Bacon, Descartes' *Discourse on Method* and his *Rules for the Direction of the Mind*, and Kant's *Critique of Pure Reason* indicate or discuss the nature, scope and divisions of the discipline which has come to be called "logic." Though of all the works mentioned the *Organon* is perhaps the most extensive treatment of the subject, Aristotle does not use the word "logic" to name the science or art of which he seems to be the inventor—certainly the first systematic expounder—in the tradition of western thought.

Here as elsewhere Aristotle is indebted to his predecessors for providing him with materials to develop or criticize: to the sophists for the construction of arguments, for the formulation of methods of disputation, and for the discovery of fallacies; to Plato for the theory of classification and definition, for the root notion of the syllogism and a conception of proof or demonstration, for the general outlines of an intellectual method to which Plato gives the name "dialectic."

As indicated in the chapter on DIALECTIC, Aristotle uses Plato's name for the whole method of the mind in the pursuit of truth, in order to designate just one part of his method, the part concerned with probability rather than truth. Yet in the Roman and mediaeval tradition, the words "logic" and "dialectic" come to be used interchangeably. This is exemplified by the Stoic division of the sciences into physics, ethics, and logic or dialectic, and by the mediaeval enumeration of the liberal arts of the *trivium* as grammar, rhetoric, and logic or dialectic. So used, these names designate the whole range of discussion to be found in Aristotle's *Organon*.

In their opposition to Aristotelian or what they sometimes call "scholastic" logic, modern

inventors of new methods, like Bacon or Descartes, tend to restrict the meaning of logic. For them logic is little more than the doctrine of the syllogism. And this they judge to be no part of genuinely fruitful method, or they hold it to be of use mainly as a critical instrument in disputation rather than discovery. Their identification of logic with dialectic (like their association of both with rhetoric) seems to have an intentionally invidious significance.

But with Kant, who was influenced by the scholasticism of Christian Wolff, "logic" is generally restored as the name for the whole range of materials in Aristotle's *Organon*, of which dialectic again becomes a part. In his own *Introduction to Logic*, Kant speaks of Aristotle as "the father of Logic." Though "logic has not gained much in extent since Aristotle's time," he says, "there are two amongst more recent philosophers who have again brought general logic into vogue, Leibnitz and Wolff." Since their day, and certainly since Kant's, as may be seen from the titles listed under Additional Readings, "logic" prevails as the name for treatises which discuss, in whole or part, the matters treated in Aristotle's *Organon*.

"Logic" is also used in modern times as the name for an inquiry or study which bears little resemblance to the discipline expounded in Aristotle's *Organon*. What is called "modern logic" to distinguish it from the traditional Aristotelian or scholastic logic, is purely a science, and in no sense an organon, methodology, instrument, or art. It does not restrict itself to stating the laws of thought or formulating the rules of inference. In the words of Josiah Royce, it is "the science of order" and it is applicable to the order of things as well as the order of thought. So conceived, the science of logic is sometimes regarded as having the kind of generality which is traditionally assigned to

metaphysics; as, for example, by Bertrand Russell in his essay, "Logic as the Essence of Philosophy."

But it is mathematics rather than metaphysics with which logic is identified by its modern exponents. "Logistic or mathematical logic," writes Russell, "is mathematical in two different senses: it is itself a branch of mathematics, and it is the logic which is specially applicable to other more traditional branches of mathematics." Since Boole's *Laws of Thought*, which, according to Russell, initiates the modern development of mathematical logic, "logic has become more mathematical and mathematics has become more logical. The consequence," he says, "is that it has now become wholly impossible to draw a line between the two; in fact, the two are one."

ARISTOTLE'S *Organon* stands to the tradition of logic as Euclid's *Elements* stands to the tradition of geometry. In both cases the work of later minds may alter considerably the structure and content of the discipline. In both cases there are modern departures from the earlier tradition. As in the one case we have Descartes' analytical geometry and the various non-Euclidean geometries, so in the other we have Kant's transcendental logic and the various non-Aristotelian logics.

But all these innovations, even when they might be described as anti-Aristotelian rather than simply as non-Aristotelian, bear the marks of their traditional origin. Kant, for example, takes pains everywhere to indicate the parallelism between the formulations of his transcendental logic and those of Aristotle's logic. Even the various systems of relational and mathematical logic usually attempt to show that the Aristotelian logic of subject and predicate, of particular and universal propositions, and of syllogisms can be treated as a special case under their own formulations. The proposals of Bacon or Mill with respect to induction and the method of Descartes, though accompanied in each case by a critique of the syllogism, are less radical departures, for they do not apparently reject Aristotle's basic doctrines of predication and proof.

Many of these issues in logical theory are dealt with in other chapters, e.g., in DIALECTIC, IN-

DUCTION, and HYPOTHESIS, in IDEA, JUDGMENT, and REASONING. Here we are principally concerned with the conception of logic itself, not with the detailed content of the science as much as with its character as an art or science, its relation to other arts and sciences, its major divisions, and its leading principles. Though such considerations are more explicitly treated by Kant than by Aristotle, the formative influence of the *Organon* warrants examining it first.

THE PARTS OF LOGIC, as Aristotle conceives them, seem to be indicated by the subject matter of the various books which comprise the collection of writings assembled under the title of *Organon*. That title has a bearing on the question whether logic is a science or an art and on its difference from other sciences and arts. The word "organon" has the meaning of instrument or method. That in turn suggests something to be used as rules of art are used—as directions to be followed to produce a certain result.

Aristotle's own differentiation of the speculative sciences, the practical sciences, and the arts throws light on this view of logic as an art. "The end of theoretical knowledge," he writes, "is truth, while that of practical knowledge is action." In other words, the theoretical, or speculative, sciences differ from the practical sciences in that they are knowledge for its own sake as opposed to knowledge for an ulterior end. According as the ulterior end is the production or "making" of something, as distinct from human action or conduct, art is distinct from the other practical sciences. "Making and acting are different," Aristotle says; "the reasoned state of capacity to act is different from the reasoned state of capacity to make. Hence, too, they are not included one in the other; for neither is acting making nor is making acting." Logic, then, if it is an art, will be concerned with the "making" of something, with producing a work or an effect.

The way in which Aristotle himself refers to the *Organon* seems to confirm this view. He regards it as a preparation for work in the theoretic sciences. "Due to a want of training in logic," he writes, some men attempt to discuss the criteria of truth in mathematics or physics at the same time that they are considering the subject matter of these sciences. "They should

know these things already when they come to a special study, and not be inquiring into them while they are listening to lectures on it." Logic, in Aristotle's view, trains the mind in the ways of science. Its productive goal as an art is the making of science itself. For this reason, in the mediaeval period, logic comes to be called a "speculative art" or, with grammar and rhetoric, a liberal art.

"Even in speculative matters," Aquinas says, "there is something by way of work, *e.g.*, the making of a syllogism, or of a fitting speech, or the work of counting or measuring. Hence whatever habits are ordained to such works of the speculative reason are, by a kind of comparison, called arts indeed, but *liberal* arts, in order to distinguish them from those arts that are ordained to works done by the body. . . . On the other hand, those sciences which are not ordained to any such work are called sciences absolutely and not arts."

But though it may not be a science, *absolutely speaking*, because it is an instrument of intellectual work, logic, in addition to being an art, may also have some of the characteristics of a science. If it is a science, what is the object of its knowledge?

Aristotle's division of the speculative sciences, which he seems to present as exhaustive, leaves no place for logic. "There are three kinds of theoretical sciences," he writes, "physics, mathematics, theology" or metaphysics, as the last came to be called. Each of these sciences, furthermore, seems to have a distinctive subject matter which is some aspect of reality, such as change, or quantity, or being. But insofar as logic is concerned with the study of terms, propositions, and syllogisms, it deals with elements common to all sciences.

This suggests that whereas reality is the object of the other sciences, the object of logic as a science is science itself, or more generally the whole of discourse. It considers the elements or patterns of discourse in a formal manner; that is, it considers them apart from their reference to reality or their real significance as the terms, propositions, and syllogisms of particular subject matters or sciences. Because it separates the forms which discursive thought takes from the matter or content it may have, logic is traditionally called a "formal science."

WHERE ARISTOTLE makes his object the elements of discourse (or thought expressed in language), later logicians treat the formal aspect of thought itself. They deal with concepts, judgments, and reasoning instead of with terms, propositions, and syllogisms. This difference results in a definition of logic as the science of thought; the basic formulations of logic are the laws of thought. Thus, for example, Kant says that logic "treats of nothing but the mere forms of thought." Its limits "are definitely fixed by the fact that it is a science which has nothing to do but fully to exhibit and strictly to prove all formal rules of thought."

The logical principles of identity, excluded middle, and contradiction, as well as the principles of inference, are said to be "laws of thought." James proposes as the most "fundamental principle of inference" what he calls the "axiom of skipped intermediaries," which states that "*skipping intermediary terms leaves relations the same.*" That "equals of equals are equal" is a special application of this principle in the sphere of quantities. Because it applies to all subject matters equally, James regards the principle as "on the whole the broadest and deepest law of man's thought."

In either conception of logic as a formal science, questions arise concerning the relation of logic to other sciences. For Aristotle the question is about logic and metaphysics, because both seem to have an unrestricted scope. Metaphysics considers the being of *everything* which is; logic, the formal components of discourse about *anything*. Aristotle says of philosophy in relation to dialectic, that both "embrace all things" but that "dialectic is merely critical where philosophy claims to know." The same comparison could apply to metaphysics and logic. Both "embrace all things" but not from the same point of view.

Aristotle also asks whether it belongs to metaphysics as well as to logic to inquire "into the truths which are called axioms"—especially those which are the first principles of all knowledge or demonstration, not merely the foundations of knowledge about some limited subject matter. "Since these truths clearly hold good for all things *qua* being," the science which studies being *qua* being (*i.e.*, metaphysics) must be concerned with them. It also belongs to

metaphysics as well as to logic "to inquire into the principles of the syllogism."

The principles of identity, excluded middle, and contradiction belong to both sciences—to the one as the most universal truths about existence, to the other as the basic rules of discourse or the laws of thought. This sharing of a common ground does not seem to Aristotle to violate their separateness; but Bacon charges him with having "corrupted natural philosophy by logic." Of Aristotle's physics, he says that it is built of "mere logical terms," and, Bacon adds, Aristotle "remodelled the same subject in his metaphysics under a more imposing title."

Whereas Aristotle considers the relation of logic to metaphysics, Kant considers its relation to psychology. Both logic and psychology are concerned with thinking and knowing. Distinguishing between pure and applied logic, Kant says that pure logic "has nothing to do with empirical principles and borrows nothing from psychology." Applied logic depends on psychology. In fact, says Kant in his *Introduction to Logic*, it is "a psychology in which we consider what is the usual process in our thought, not what is the right one." Applied logic ought not to be called logic at all, for "logic is the science of the right use of the understanding and the reason generally, not subjectively, that is, not according to empirical (psychological) principles, as to how the understanding actually thinks, but objectively, that is, according to *a priori* principles, as to how it ought to think."

James also insists upon the distinction between psychology and logic. He even uses Kant's terms in calling logic an *a priori* and psychology an empirical science. What the psychologist calls "laws of thought," such as the laws of the association of ideas, describe the actual flow of thought and connections which depend upon similarity and succession. The laws of logic, in contrast, state reason's perception of the rational structure of thought itself and the relations which must obtain if thought is to be rational.

RETURNING NOW to the indication of the parts of logic which may be found in the structure of the *Organon*, we can see two orders in the books. The first three books—the *Categories*, *On Interpretation*, and the *Prior Analytics*—deal with terms, propositions, and syllogisms: with the

classification of terms and their relation to one another; with the classification of propositions and their opposition to one another; with the analysis of the various types of syllogisms and the formulation of the rules of valid inference. Terms are the elements of propositions; terms and propositions are the elements of the syllogism. This seems to determine the order of the first three books.

The first three books as a whole stand in a certain order to the remaining books. Taking the latter as a group, their differentiation from what precedes them seems to lie in the fact that they deal with terms, propositions, and syllogisms, not abstracted from all considerations of knowledge and truth about reality, but rather with primary emphasis upon the logic of actual knowledge, or on the processes of knowing and arguing about what is true or probable. In the traditional development of Aristotelian logic, this division between the first three and the remaining books of the *Organon* is sometimes characterized as a distinction between *formal* and *material* logic.

In the *Posterior Analytics* and the *Topics* Aristotle considers the discovery and establishment of either the true or the probable. He distinguishes between induction and syllogism (or reasoning) as modes of learning and arguing. The later division of logic into deductive and inductive—sometimes confused with the distinction between formal and material logic—does not seem to correspond to the difference between the *Prior* and the *Posterior Analytics*. In the *Advancement of Learning*, for example, Bacon divides the art of judgment, "which treats of the nature of proof or demonstration," into that which concludes by induction and that which concludes by syllogism; whereas Aristotle appears to treat induction as that upon which syllogistic demonstration depends for its primary and indemonstrable premises.

The distinction between truth and probability, or between knowledge and opinion, does not affect the formal character of either induction or syllogism. A syllogism may be scientific (*i.e.*, demonstratively certain) or dialectical (*i.e.*, merely probable) according to the character of its premises. In either case its formal structure remains the same. Similarly, the difference between scientific and dialectical induction ap-

pears only in its result, *i.e.*, whether it is knowledge or opinion. The *Posterior Analytics* and the *Topics* consider the employment of both syllogism and induction. The *Posterior Analytics* treats them in relation to the development and structure of scientific knowledge. The *Topics* discusses them in relation to the dialectical procedures of argument and discovery.

The last book of the *Organon*, which is concerned with exposing the fallacies in sophistical proofs or refutations, serves to protect both scientific and dialectical reasoning from such sophistry. Unlike the philosopher or the dialectician, the sophist does not aim at the truth. Sophistry misuses the weapons of logic—the same weapons used by the scientist or dialectician—to produce a counterfeit of wisdom or, as Aristotle says, “a wisdom which exists only in semblance.” Though the dialectician cannot claim to know, he does, nevertheless, deal with opinions critically and respects the canons of logic as much as the philosopher.

The art of logic seems to have three main employments. To its use by the scientist and the dialectician, Aristotle adds its utilization by the orator for the purposes of persuasion. The rhetorician and the dialectician are most closely allied because both deal with probabilities and disputable matters concerning which opposite conclusions can be drawn. “As in dialectic, there is induction on the one hand and syllogism. . . on the other, so it is in rhetoric.” Aristotle says that “the enthymeme is a rhetorical syllogism, and the example a rhetorical induction.”

The foregoing suggests that a certain order obtains between two of the three arts traditionally called the *trivium*. The elements and principles of logic are, in a sense, prior to the rules of rhetoric. The art of rhetoric depends on and uses logic. The third art, that of grammar, seems to serve both logic and rhetoric. It serves the logician in his task of forming terms and propositions out of words, phrases, and sentences. It serves the rhetorician in his effort to make a forceful use of language. This conception of the uses of grammar appears in Aristotle’s *Rhetoric* in his consideration of style, and in the opening books of the *Organon* in his discussion of univocal and equivocal names, the parts of speech, simple and composite expressions, and the different types of sentences.

KANT SEEMS TO diverge from Aristotle both with regard to the unity of logic and with regard to the nature and relation of its parts. Formal or elementary logic, Kant thinks, is not the same as an organon of the sciences. He explains, in his *Introduction to Logic*, that an organon gives instruction as to “how some particular branch of knowledge is to be attained. . . . An organon of the sciences is therefore not a mere logic, since it presupposes the accurate knowledge of the objects and sources of the sciences. . . . Logic, on the contrary, being the general propaedeutic of every use of the understanding and of the reason, cannot meddle with the sciences and anticipate their matter.” Conceding that it may be called an organon so far as it serves, “not for the *enlargement*, but only for the *criticism* and *correction* of our knowledge,” Kant insists that “logic is not a general art of discovery, nor an organon of truth; it is not an algebra by the help of which hidden truths may be discovered.”

Aristotle, according to Kant, treats the whole of his logic as an organon, dividing it into an analytical and a dialectical part. As Kant sees it, the dialectical part arises from a misuse of the analytical part. This occurs, he says in the *Critique of Pure Reason*, when general or elementary logic (*i.e.*, the analytic part) “which is meant to be a mere canon of criticism, is employed as if it were an organon, for the real production of at least the semblance of objective assertions. . . . This general logic,” says Kant, “which assumes the semblance of an organon, is called dialectic.”

Kant here seems to identify dialectic with what Aristotle calls sophistry. He says of dialectic that “different as are the significations in which the ancients use this name of a science or art, it is easy to gather from its actual employment that with them it was nothing but a logic of semblance. It was a sophistic art of giving to one’s ignorance, nay, to one’s intentional casuistry, the outward appearance of truth, by imitating the accurate method which logic always requires.” When logic is treated as an organon, it “is always an illusive logic, that is, dialectical. For as logic teaches nothing with regard to the contents of knowledge . . . any attempt at using it as an organon in order to extend and enlarge our knowledge, at least in appearance, can end

in nothing but mere talk, by asserting with a certain plausibility anything one likes, or, if one likes, denying it."

Yet Kant himself retains Analytic and Dialectic as the major divisions of his own transcendental logic, explaining that he employs the title of dialectic, not for the misuse of logic, but rather to signify that portion of logic which is the critique of "dialectical semblance" or sophistry. General or ordinary logic takes no account of the content of knowledge and applies to all objects universally because "it treats of the form of thought in general." Transcendental logic does not entirely ignore the content of knowledge, but only the content of that knowledge which is empirical in origin. If there are transcendental or *a priori* concepts which do not originate from experience, then there can be a science which treats "of that knowledge which belongs to the pure understanding, and by which we may think objects entirely *a priori*."

That is the science Kant calls "*transcendental Logic*." It deals, he writes, "with the laws of the understanding and reason in so far only as they refer *a priori* to objects." That part of it "which teaches the elements of the pure knowledge of the understanding, and the principles without which no object can be thought, is the transcendental Analytic." The second part of it is the transcendental Dialectic—"a critique of the understanding and reason with regard to their hyperphysical employment, in order thus to lay bare the false semblance of its groundless pretensions . . . serving as a protection of the pure understanding against all sophistical illusions."

THE ISSUE between Kant and Aristotle cannot be understood if it is read simply as a dispute about the nature and divisions of logic. Their diverse views of logic must be seen against the larger background of their philosophical differences with regard to the nature of the mind, the nature of reality, the origin of knowledge, and the character of its objects. Controversies about logic (and even within logic, about this or that theory of judgment or reasoning) usually reflect fundamental issues in psychology and metaphysics. The attack made by some modern logicians, for example, against the subject-predicate logic of Aristotle cannot be separated from their rejection of his doctrine of substance and

accident in physics and metaphysics; even as their own relational logic represents a different view of the structure of reality or the constituents of experience.

On the other hand, the criticism of Aristotelian logic by Bacon and Descartes seems to be motivated primarily by considerations of method. They do not have a different logic to propose, as do Kant and later symbolic or mathematical logicians. Rather for them logic itself—by which they mean Aristotle's logic and particularly his doctrine of the syllogism—appears useless for the purposes of enlarging knowledge, discovering new truths, and developing the sciences. Where Kant criticizes Aristotle for regarding logic as an organon or method for acquiring knowledge, Bacon and Descartes complain that logic does not serve that purpose at all, and therefore a *novum organum*—not a new logic, but a new method—is needed.

"The present system of logic is useless for the discovery of the sciences," Bacon writes. It "rather assists in confirming and rendering inveterate the errors founded on vulgar notions than in searching after truth, and is therefore more hurtful than useful." The syllogism, for example, "is unequal to the subtlety of nature. . . . Our only hope is in genuine induction." Induction is the key to an art of discovery, and the rules of induction the heart of a fruitful method of inquiry.

The relation of induction to demonstration in Aristotle's logic, and the difference between Aristotle's and Bacon's theories of induction, are discussed in the chapter on that subject. In Bacon's view, the *Novum Organum* departs radically from the old *Organon*. The new can be substituted for the old in its entirety. It may be asked, he says, "whether we talk of perfecting natural philosophy alone according to our method, or the other sciences also, such as logic, ethics, politics." His answer is that "as common logic, which regulates matters by syllogisms, is applied not only to natural, but also to every other science, so our inductive method likewise comprehends them all."

Demonstration is opposed not only to induction, but to discovery. Accordingly, logic conceived as concerned only with the rules of demonstration is opposed to other methods which aim at directing scientific inquiry and research.

The basic contrast is between criticism and construction, or between examining what is offered as knowledge for its validity and developing techniques for adding new knowledge to old. In his *Two New Sciences* Galileo says that logic "teaches us how to test the conclusiveness of any argument or demonstration already discovered and completed" but not "to discover correct arguments and demonstrations." It does not, "as regards stimulation to discovery, compare with the power of sharp distinction which belongs to geometry."

In the same vein Descartes says of logic that "the syllogisms and the great part of the other teaching serve better in explaining to others those things that one knows . . . than in learning what is new. . . . This made me feel that some other method must be found." The four rules of the method he then states, which codify the steps he himself has taken to make discoveries in geometry and physics, seem to him a general procedure for insuring the advancement of all fields of learning.

As his *Rules for the Direction of the Mind* indicates, Descartes' method does not omit the intuition of principles and the deduction of conclusions therefrom—the apparent equivalents of induction and demonstration in Aristotle's *Organon*. But he explains why he has "omitted all the precepts of the dialecticians" even though he is himself concerned with improving "our power of deducing one truth from another." Their style of argument, he says, "contributes nothing at all to the discovery of the truth. . . . Its only possible use is to serve to explain at times more easily to others the truths we have already ascertained; hence it should be transferred from Philosophy to Rhetoric."

Furthermore, the forms of the traditional syllogism do not seem able to accommodate the connections in mathematical reasoning or the structure of mathematical proof. "Everyone will perceive in mathematical demonstrations," Locke writes, "that the knowledge gained thereby, comes shortest and clearest without syllogisms." Locke identifies logic with the doctrine of the syllogism and, even more explicitly than Descartes, rejects it as an aid to reasoning.

THE QUESTION whether logic is itself a methodology, or includes rules for the discovery as

well as the demonstration of truth, is answered in terms of broader and narrower conceptions of the science or art. Those who regard the rules of logic as primarily a canon of criticism, which test the validity of intellectual work, look elsewhere for a method whose rules are productive rather than critical. The question then usually arises whether there is one methodology applicable to *all* fields of inquiry, or as many distinct methods as there are different disciplines or subject matters.

The difference between the traditional Aristotelian and the modern mathematical logic suggests that there may be a plurality of logics. The attempts made by the exponents of each to subsume the other as a special case do not seem to be entirely successful. Though Aristotelian logic appears to give a satisfactory account of the forms of judgment and reasoning in certain types of discourse, it cannot, in the opinion of symbolic logicians, be applied to mathematics. "Mathematics consists of deductions, and yet," according to Bertrand Russell, "the orthodox accounts of deduction are largely or wholly inapplicable to existing mathematics." Symbolic logic, on the other hand, may succeed in formulating the relational structure of modern mathematics, but it does not, in the opinion of its critics, hold for metaphysics—at least not the sort of metaphysics which treats relation as a category subordinate to substance.

The difference between the kind of thinking that men do in science and in law suggests another type of diversity among logics. The practical or moral judgment seems to involve a special type of predicate. What Aristotle calls the "practical syllogism" and what Aquinas describes as the process of "determination"—quite distinct from deduction—by which positive laws are derived from natural law, seem to call for a logic of practical thinking, quite distinct from the logic of all the theoretic sciences.

Using the word "logic" in its broadest sense, we must ask whether there is one logic common to all the sciences; or a logic which fits mathematics but not physics or metaphysics, a logic appropriate to speculative philosophy but not to experimental or empirical research, a logic peculiar to the nature of the practical or moral sciences, such as ethics and politics, or to the work of jurisprudence.

There is evidence in the great books that sciences as different as mathematics and physics, or as metaphysics and politics, differ in their methods of discovery and demonstration. This may mean that they differ in their logics as well. Yet it also appears to be the case that the principle of contradiction applies in all, that fallacious inference is detected by the same criteria in all, and to this extent all share a common logic. Where alternative methods have been proposed within a single major field—notably in the case of philosophy—this may reflect different conceptions of philosophy itself rather than alternative routes to the same end.

Because of their relevance to the basic issues about logic (and especially those concerning its scope and unity), the rules of methodology in general and the various methods proposed for particular disciplines are included in this chapter. They are also considered, of course, in chapters devoted to the special disciplines or subject matters, *e.g.*, ASTRONOMY, HISTORY, MATHEMATICS, METAPHYSICS, PHYSICS, THEOLOGY; and in the chapters on SCIENCE and PHILOSOPHY. What is distinctive about each of these methods is discussed in those chapters in relation to the type of knowledge or inquiry which seems to require a method of its own.

OUTLINE OF TOPICS

	PAGE
1. Logic as a science: its scope and subject matter compared with psychology and metaphysics	1043
1a. The axioms of logic: the laws of thought; the principles of reasoning	
1b. Divisions of logic: deductive and inductive; formal and material; analytic and dialectic; general and transcendental	1044
2. Transcendental logic: the propaedeutic to all <i>a priori</i> cognition; the transcendental doctrine of method	
3. Logic as an art: its place in education	
3a. The relation of logic and grammar	
3b. The relation of logic and rhetoric	1045
4. Methodology: rules for the conduct of the mind in the processes of thinking, learning, inquiring, knowing	
4a. Mathematical analysis and reasoning: the search for a universal method	
4b. The heuristic principles of research in experimental and empirical science	1046
4c. The criteria of evidence and inference in historical inquiry	1047
4d. The diverse methods of speculative philosophy: the role of intuition, analysis, dialectic, genetic or transcendental criticism	
4e. The logic of practical thinking: the methods of ethics, politics, and jurisprudence	1048
4f. Theological argument: the roles of faith, reason, and authority	
5. Logic as an object of satire and criticism: sophistry and logic-chopping	1049

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 50: LOVE

INTRODUCTION

HERE, as in the chapters on GOD and MAN, almost all the great books are represented except those in mathematics and the physical sciences. Even those exceptions do not limit the sphere of love. As the theologian understands it, love is not limited to things divine and human, nor to those creatures less than man which have conscious desires. Natural love, Aquinas writes, is not only "in all the soul's powers, but also in all the parts of the body, and universally in all things: because, as Dionysius says, 'Beauty and goodness are beloved by all things.'"

Love is everywhere in the universe—in all things which have their being from the bounty and generosity of God's creative love and which in return obey the law of love in seeking God or in whatever they do to magnify God's glory. Love sometimes even takes the place of other gods in the government of nature. Though he thinks the motions of the world are without direction from the gods, Lucretius opens his poem *On the Nature of Things* with an invocation to Venus, "the life-giver"—without whom nothing "comes forth into the bright coasts of life, nor waxes glad nor lovely."

Nor is it only the poet who speaks metaphorically of love as the creative force which engenders things and renews them, or as the power which draws all things together into a unity of peace, preserving nature itself against the disruptive forces of war and hate. The imagery of love appears even in the language of science. The description of magnetic attraction and repulsion borrows some of its fundamental terms from the vocabulary of the passions; Gilbert, for example, refers to "the love of the iron for the loadstone."

On the other hand, the impulses of love are often compared with the pull of magnetism. But such metaphors or comparisons are seldom intended to conceal the ambiguity of the word

"love" when it is used as a term of universal application. "Romeo wants Juliet as the filings want the magnet," writes William James, "and if no obstacles intervene he moves toward her by as straight a line as they. But Romeo and Juliet, if a wall be built between them, do not remain idiotically pressing their faces against its opposite sides"—like iron filings separated from the magnet by a card.

THE LOVE BETWEEN man and woman makes all the great poems contemporaneous with each other and with ourselves. There is a sense in which each great love affair is unique—a world in itself, incomparable, unconditioned by space and time. That, at least, is the way it feels to the romantic lovers, but even to the dispassionate observer there seems to be a world of difference between the relationship of Paris and Helen in the *Iliad* and that of Prince Andrew and Natasha in *War and Peace*, or Troilus and Cressida, Tom Jones and Sophia, Don Quixote and Dulcinea, Jason and Medea, Aeneas and Dido, Othello and Desdemona, Dante and Beatrice, Hippolytus and Phaedra, Faust and Margaret, Henry V and Catherine, Paola and Francesca, Samson and Delilah, Antony and Cleopatra, Admetus and Alcestis, Orlando and Rosalind, Haemon and Antigone, Odysseus and Penelope, and Adam and Eve.

The analyst can make distinctions here. He can classify these loves as the conjugal and the illicit, the normal and the perverse, the sexual and the idyllic, the infantile and the adult, the romantic and the Christian. He can, in addition, group all these loves together despite their apparent variety and set them apart from still other categories of love: the friendships between human beings without regard to gender; the familial ties—parental, filial, fraternal; the love of a man for himself, for his fellow men, for his

country, for God. All these other loves are, no less than the love between man and woman, the materials of great poetry even as they are omnipresent in every human life.

The friendship of Achilles and Patroclus dominates the action of the *Iliad* even more, perhaps, than the passion of Paris for Helen. The love of Hamlet for his father and, in another mood, for his mother overshadows his evanescent tenderness for Ophelia. Prince Hal and Falstaff, Don Quixote and Sancho Panza, Pantagruel and Panurge seem to be bound more closely by companionship than any of them is ever tied by Cupid's knot. The love of Cordelia for Lear surpasses, though it does not defeat, the lusts of Goneril and Regan. The vision of Rome effaces the image of Dido from the heart of Aeneas. Brutus lays down his life for Rome as readily as Antony gives up his life for Cleopatra.

Richard III, aware that he "wants love's majesty," implies that he cannot love anyone because he is unable to love himself. Why should "I love myself," he asks, "for any good that I myself have done unto myself"? This element of self-love which, in varying degrees, prompts the actions of Achilles, Odysseus, Oedipus, Macbeth, Faust, and Captain Ahab, finds its prototype in the almost infinite *amour-propre* of Lucifer in *Paradise Lost*. This self-love, which in its extreme form the psychoanalyst calls "narcissism," competes with every other love in human life. Sometimes it qualifies these other loves; when, for example, it enters into Pierre Bezúkhov's meditations about freeing his serfs and turns his sentiment of brotherly love into a piece of sentimentality which is never confirmed by action.

Yet self-love, like sexual love, can be overcome by the love which is charity toward or compassion for others. True self-love, according to Locke, necessarily leads to love of neighbor; and, in Dante's view of the hierarchy of love, men ascend from loving their neighbors as themselves to loving God. Through the love he bears Virgil and Beatrice for the goodness they represent, Dante mounts to the highest heaven where he is given the Good itself to love.

The panorama of human love is not confined to the great works of poetry or fiction. The same drama, with the same types of plot and

character, the same lines of action, the same complications and catastrophes, appears in the great works of history and biography. The stories of love told by Herodotus, Thucydides, Plutarch, Tacitus, and Gibbon run the same gamut of the passions, the affections, the tender feeling and the sacrificial devotion, in the attachments of the great figures of history.

Here the loves of a few men move the lives of many. History itself seems to turn in one direction rather than another with the turning of an emperor's heart. Historic institutions seem to draw their strength from the ardor of a single patriot's zeal; and the invincible sacrifices of the martyrs, whether to the cause of church or state, seem to perpetuate with love what neither might of arms nor skill of mind could long sustain. History's blackest as well as brightest pages tell of the lengths to which men have gone for their love's sake, and as often as not the story of the inner turbulence lies half untold between the lines which relate the consequences in acts of violence or heroism.

STILL OTHER OF THE great books deal with love's exhibition of its power. A few of the early dialogues of Plato discuss love and friendship, but more of them dramatically set forth the love his disciples bear Socrates, and Socrates' love of wisdom and the truth. Montaigne can be skeptical and detached in all matters. He can suspend judgment about everything and moderate every feeling by the balance of its opposite, except in the one case of his friendship with Etienne de la Boetie where love asserts its claims above dispute and doubt. The princely examples with which Machiavelli documents his manual of worldly success are lovers of riches, fame, and power—that triad of seducers which alienates the affections of men for truth, beauty, and goodness.

The whole of Pascal's meditations, insofar as they are addressed to himself, seems to express one thought, itself a feeling. "The heart has its reasons, which the reason does not know. We feel it in a thousand things. I say that the heart naturally loves the Universal Being, and also itself, according as it gives itself to them; and it hardens itself against one or the other at its will. You have rejected the one, and kept the other. Is it by reason that you love yourself?"

In the *Confessions* of Augustine, a man who finally resolved the conflict of his loves lets his memory dwell on the torment of their disorder, in order to repent each particular sin against the love of God. "What was it that I delighted in," he writes, "but to love, and be beloved? but I kept not the measure of love, of mind to mind, friendship's bright boundary; but out of the muddy concupiscence of the flesh, and the bubblings of youth, mists fumed up which beclouded and overcast my heart, that I could not discern the clear brightness of love, from the fog of lustfulness."

Augustine shows us the myriad forms of concupiscence and avarice in the lusting of the flesh and of the eyes, and in the self-love which is pride of person. In no other book except perhaps the Bible are so many loves arrayed against one another. Here, in the life of one man, as tempestuous in passion as he was strong of will, their war and peace produce his bondage and his freedom, his anguish and his serenity.

In the Bible, the history of mankind itself is told in terms of love, or rather the multiplicity of loves. Every love is here—of God and Mammon, perverse and pure, the idolatry and vanity of love misplaced, every unnatural lust, every ecstasy of the spirit, every tie of friendship and fraternity, and all the hates which love engenders.

THESE BOOKS of poetry and history, of meditation, confession, and revelation, teach us the facts of love even when they do not go beyond that to definition and doctrine. Before we turn to the theory of love as it is expounded by the philosophers and theologians, or to the psychological analysis of love, we may find it useful to summarize the facts of which any theory must take account. And on the level of the facts we also meet the inescapable problems which underlie the theoretical issues formed by conflicting analyses.

First and foremost seems to be the fact of the plurality of loves. There are many different kinds of love—different in object, different in tendency and expression—and as they occur in the individual life, they raise the problem of unity and order. Does one love swallow up or subordinate all the others? Can more than one love rule the heart? Is there a hierarchy of

loves which can harmonize all their diversity? These are the questions with which the most comprehensive theories of love find it necessary to begin.

Plato's ladder of love in the *Symposium* has different loves for its rungs. Diotima, whom Socrates describes as his "instructress in the art of love," tells him that if a youth begins by loving a visibly beautiful form, "he will soon of himself perceive that the beauty of one form is akin to the beauty of another," and, therefore, "how foolish would he be not to recognize that the beauty in every form is one and the same." He will then "abate his violent love of the one," and will pass from being "a lover of beautiful forms" to the realization that "the beauty of the mind is more honorable than the beauty of the outward form." Thence he will be led to love "the beauty of laws and institutions . . . and after laws and institutions, he will go on to the sciences, that he may see their beauty." As Diotima summarizes it, the true order of love "begins with the beauties of earth and mounts upwards . . . from fair forms to fair practices, and from fair practices to fair notions, until from fair notions [we] arrive at the notion of absolute beauty."

Aristotle classifies different kinds of love in his analysis of the types of friendship. Since the lovable consists of "the good, pleasant, or useful," he writes, "there are three kinds of friendship, equal in number to the things that are lovable; for with respect to each there is a mutual and recognized love, and those who love each other wish well to each other in that respect in which they love one another." Later in the *Ethics* he also considers the relation of self-love to all love of others, and asks "whether a man should love himself most, or someone else."

Aquinas distinguishes between love in the sphere of the passions and love as an act of will. The former he assigns to what he calls the "concupiscible faculty" of the sensitive appetite; the latter, to the "rational or intellectual appetite." The other basic distinction which Aquinas makes is that between love as a natural tendency and as a supernatural habit. Natural love is that "whereby things seek what is suitable to them according to their nature." When love exceeds the inclinations of nature, it

does so by "some habitual form superadded to the natural power," and this habit of love is the virtue of charity.

Freud's theory places the origin of love in the sexual instincts, and so for him the many varieties of love are simply the forms which love takes as the libido fixes upon various objects. "The nucleus of what we mean by love," he writes, "naturally consists . . . in sexual love with sexual union as its aim. We do not separate from this," he goes on to say, "on the one hand, self-love, and on the other, love for parents and children, friendship and love for humanity in general, and also devotion to concrete objects and to abstract ideas . . . All these tendencies are an expression of the same instinctive activities." They differ from sexual love only because "they are diverted from its aim or are prevented from reaching it, though they always preserve enough of their original nature to keep their identity recognizable." Sexual love undergoes these transformations according as it is repressed or sublimated, infantile or adult in its pattern, degraded to the level of brutal sexuality or humanized by inhibitions and mixed with tenderness.

All of these classifications and distinctions belong to the theory of human love. But the fact of love's diversity extends the theory of love to other creatures and to God. In the tradition of biology from Aristotle to Darwin, the mating of animals and the care of their young is thought to exhibit an emotion of love which is either sharply contrasted with or regarded as the root of human love. Darwin, for example, maintains, "it is certain that associated animals have a feeling of love for each other, which is not felt by non-social adult animals."

At the opposite pole, the theologians identify God with love and see in God's love for Himself and for His creatures the principle not only of creation, and of providence and salvation, but also the measure of all other loves by which created things, and men especially, turn toward or away from God. "Beloved, let us love one another," St. John writes, "for love is of God; and everyone that loveth is born of God, and knoweth God. He that loveth not knoweth not God; for God is love. In this was manifested the love of God toward us, because that God

sent his only begotten Son into the world, that we might live through him. Herein is love, not that we loved God, but that he loved us . . . And we have known and believed the love that God hath to us. God is love; and he that dwelleth in love dwelleth in God, and God in him."

In the moral universe of the *Divine Comedy*, heaven is the realm of love, "pure light," Beatrice says, "light intellectual full of love love of true good full of joy, joy which transcends every sweetness." There courtesy prevails among the blessed, and charity alone of the theological virtues remains. The beatitude of those who see God dispenses with faith and hope, but the vision of God is inseparable from the fruition of love. "The Good which is the object of the will," Dante writes, "is all collected in it; and outside of it, that is defective which is perfect there." Desire and will are "revolved, like a wheel which is moved evenly, by the Love which moves the sun and the other stars." Hell is made by the absence of God's love—the punishment of those who on earth loved other things more than God.

THERE IS A second fact about love to which poetry and history bear testimony. Love frequently turns into its opposite, hate. Sometimes there is love and hate of the same object; sometimes love inspires hate, as it occasions jealousy, of the things which threaten it. Anger and fear, too, follow in the wake of love. Love seems to be the primal passion, generating all the others according to the oppositions of pleasure and pain and by relations of cause and effect. Yet not all the analysts of love as a passion seem to agree upon this point, or at least they do not give the fact the same weight in their theories.

Hobbes, for example, gives primacy to fear, and Spinoza to desire, joy, and sorrow. Spinoza defines love as "joy with the accompanying idea of an external cause," and he defines hatred similarly in terms of sorrow. Nevertheless, Spinoza, like Aquinas and Freud, deals more extensively with love and hate than with any of the other passions. He, like them, observes how their fundamental opposition runs through the whole emotional life of man. But he does not, like Aquinas, regard love as the root of all the other passions. Treating the combination

of love and hate toward the same object as a mere "vacillation of the mind," he does not, like Freud, develop an elaborate theory of emotional ambivalence which tries to explain why the deepest affections of men are usually mixtures of love and hate.

A THIRD FACT which appears in almost every one of the great love stories points to another aspect of love's contrariness. There seems to be no happiness more perfect than that which love confirms. But there is also no misery more profound, no depth of despair greater, than that into which lovers are plunged when they are bereft, disappointed, unrequited. Can the pleasures of love be had without its pains? Is it better to have loved and suffered than never to have loved at all? Is it wiser not to love than to love not wisely but too well? Is the world well lost for love?

These questions paraphrase the soliloquies of lovers in the great tragedies and comedies of love. For every praise of love there is, in Shakespearean speech or sonnet, an answering complaint. "All creatures in the world through love exist, and lacking love, lack all that may persist." But "thou blind fool, love, what does thou to mine eyes, that they behold and see not what they see?" "The greater castle of the world is lost," says Antony to Cleopatra; "we have kissed away kingdoms and provinces." But in Juliet's words to Romeo, "My bounty is as boundless as the sea, my love as deep; the more I give to thee, the more I have, for both are infinite."

Love is all opposites—the only reality, the great illusion; the giver of life and its consumer; the benign goddess whose benefactions men beseech, and—to such as Hippolytus or Dido—the dread Cyprian who wreaks havoc and devastation. She is a divinity to be feared when not propitiated, her potions are poison, her darts are shafts of destruction. Love is itself an object of love and hate. Men fall in love with love and fight against it. *Omnia vincit amor*, Virgil writes—"love conquers all."

In the dispassionate language of the moralist, the question is simply whether love is good or bad, a component of happiness or an obstacle thereto. How the question is answered depends upon the kind of love in question. The love

which consists in the best type of friendship seems indispensable to the happy life and, more than that, to the fabric of any society, domestic or political.

Such love, Aristotle writes, "is a virtue or implies virtue, and is besides most necessary with a view to living. For without friends no one would choose to live though he had all other goods. . . . Friendship seems too to hold states together, and lawgivers care more for it than for justice." When it is founded on virtue, it goes further than justice, for it binds men together through benevolence and generosity. "When men are friends," Aristotle says, "they have no need of justice."

But Aristotle does not forget that there are other types of friendship, based on utility or pleasure-seeking rather than upon the mutual admiration of virtuous men. Here, as in the case of other passions, the love may be good or bad. It is virtuous only when it is moderated by reason and restrained from violating the true order of goods, in conformity to which man's various loves should themselves be ordered.

When the love in question is the passion of the sexual instinct, some moralists think that temperance is an inadequate restraint. Neither reason nor law is adequate to the task of subduing—or, as Freud would say, of domesticating—the beast. To the question Socrates asks, whether life is harder towards the end, the old man Cephalus replies in the words of Sophocles, when he was asked how love suits with age, "I feel as if I had escaped from a mad and furious master."

In the most passionate diatribe against love's passion, Lucretius condemns the sensual pleasures which are so embittered with pain. Venus should be entirely shunned, for once her darts have wounded men, "the sore gains strength and festers by feeding, and day by day the madness grows, and the misery becomes heavier. . . . This is the one thing, whereof the more and more we have, the more does our heart burn with the cursed desire. . . . When the gathering desire is sated, the old frenzy is back upon them . . . nor can they discover what device may conquer their disease; in such deep doubt they waste beneath their secret wound . . . These ills are found in love that is true and fully prosperous; but when love is crossed and hopeless,

there are ills which you might detect with closed eyes, ills without number; so that it is better to be on the watch beforehand, even as I have taught you, and to beware that you are not entrapped. For to avoid being drawn into the meshes of love, is not so hard a task as when caught amid the toils to issue out and break through the strong bonds of Venus."

In the doctrines of most moralists, however, the sexual passion calls for no special treatment different from other appetites and passions. Because it is more complex in its manifestations, perhaps, and more imperious in its urges, more effort on the part of reason may be required to regulate it, to direct or restrain it. Yet no special principles of virtue or duty apply to sexual love. Even the religious vow of chastity is matched by the vow of poverty. The love of money is as serious a deflection from loving God as the lust of the flesh.

WHAT IS COMMON to all these matters is discussed in the chapters on DUTY, EMOTION, VIRTUE, and SIN. But here one more fact remains to be considered—the last fact about love which the poets and the historians seem to lay before the moralists and theologians.

When greed violates the precepts of justice, or gluttony those of temperance, the vice or sin appears to have no redeeming features. These are weaknesses of character incompatible with heroic stature. But many of the great heroes of literature are otherwise noble men or women who have, for love's sake, deserted their duty or transgressed the rules of God and man, acknowledging their claims and yet choosing to risk the condemnation of society even to the point of banishment, or to put their immortal souls in peril. The fact seems to be that only love retains some honor when it defies morality; not that moralists excuse the illicit act, but that in the opinion of mankind, as evidenced by its poetry at least, love has some privileged status. Its waywardness and even its madness are extenuated.

The poets suggest the reason for this. Unlike the other passions which man shares with the animals, characteristically human love is a thing of the spirit as well as the body. A man is piggish when he is a glutton, a jackal when he is craven, but when his emotional excess in

the sphere of love lifts him to acts of devotion and sacrifice, he is incomparably human. That is why the great lovers, as the poets depict them, seem admirable in spite of their transgressions. They almost seem to be justified—poetically, at least, if not morally—in acting as if love exempted them from ordinary laws; as if their love could be a law unto itself. "Who shall give a lover any law?" Arcite asks in Chaucer's *Knight's Tale*. "Love is a greater law," he says, "than man has ever given to earthly man."

To a psychologist like Freud, the conflict between the erotic impulses and morality is the central conflict in the psychic life of the individual and between the individual and society. There seems to be no happy resolution unless each is somehow accommodated to the other. At one extreme of repression, "the claims of our civilization," according to Freud, "make life too hard for the greater part of humanity, and so further the aversion to reality and the origin of neuroses"; the individual suffers neurotic disorders which result from the failure of the repressed energies to find outlets acceptable to the moral censor. At the other extreme of expression, the erotic instinct "would break all bounds and the laboriously erected structure of civilization would be swept away." Integration would seem to be achieved in the individual personality and society would seem to prosper only when sexuality is transformed into those types of love which reinforce laws and duties with emotional loyalty to moral ideals and invest ideal objects with their energies, creating the highest goods of civilization.

To the theologian, the conflict between love and morality remains insoluble—not in principle, but in practice—until love itself supplants all other rules of conduct. The "good man," according to Augustine, is not he "who knows what is good, but who loves it. Is it not then obvious," he goes on to say, "that we love in ourselves the very love wherewith we love whatever we love? For there is also a love wherewith we love that which we ought not to love; and this love is hated by him who loves that wherewith he loves what ought to be loved. For it is quite possible for both to exist in one man. And this co-existence is good for a man, to the end that this love which conduces to our

living well may grow, and the other, which leads us to evil may decrease, until our whole life be perfectly healed and transmuted into good." Only a better love, a love that is wholly virtuous and right, has the power requisite to overcome love's errors. With this perfect love goes only one rule, Augustine says: *Dilige, et quod vis fac*—"love, and do what you will."

This perfect love, which alone deserves to be a law unto itself, is more than fallen human nature can come by without God's grace. It is, according to Christian theology, the supernatural virtue of charity whereby men participate in God's love of Himself and His creatures—loving God with their whole heart and soul and mind, and their neighbors as themselves. On these two precepts of charity, according to the teaching of Christ, "depends the whole law and the prophets."

The questions which Aquinas considers in his treatise on charity indicate that the theological resolution of the conflict between love and morality is, in essence, the resolution of a conflict between diverse loves, a resolution accomplished by the perfection of love itself. Concerning the objects and order of charity, he asks, for example, "whether we should love charity out of charity," "whether irrational creatures also ought to be loved out of charity," "whether a man ought to love his body out of charity," "whether we ought to love sinners out of charity," "whether charity requires that we should love our enemies," "whether God ought to be loved more than our neighbors," "whether, out of charity, man is bound to love God more than himself," "whether, out of charity, man ought to love himself more than his neighbor," "whether a man ought to love his neighbor more than his own body," "whether we ought to love one neighbor more than another," "whether we ought to love those who are better more than those who are more closely united to us," "whether a man ought, out of charity, to love his children more than his father," "whether a man ought to love his wife more than his father and mother," "whether a man ought to love his benefactor more than one he has benefited."

THE DIVERSITY of love seems to be both the basic fact and the basic problem for the psy-

chologist, the moralist, the theologian. The ancient languages have three distinct words for the main types of love: *eros*, *philia*, *agape* in Greek; *amor*, *amicitia* (or *dilectio*), and *caritas* in Latin. Because English has no such distinct words, it seems necessary to use such phrases as "sexual love," "love of friendship," and "love of charity" in order to indicate plainly that love is common to all three, and to distinguish the three meanings. Yet we must observe what Augustine points out, namely, that the Scriptures "make no distinction between *amor*, *dilectio*, and *caritas*," and that in the Bible "*amor* is used in a good connection."

The problem of the kinds of love seems further to be complicated by the need to differentiate and relate love and desire. Some writers use the words "love" and "desire" interchangeably, as does Lucretius who, in speaking of the pleasures of Venus, says that "Cupid [*i.e.*, desire] is the Latin name of love." Some, like Spinoza, use the word "desire" as the more general word and "love" to name a special mode of desire. Still others use "love" as the more general word and "desire" to signify an aspect of love. "Love," Aquinas writes, "is naturally the first act of the will and appetite; for which reason all the other appetitive movements presuppose love, as their root and origin. For nobody desires anything nor rejoices in anything, except as a good that is loved."

One thing seems to be clear, namely, that both love and desire belong to the appetitive faculty—to the sphere of the emotions and the will rather than to the sphere of perception and knowledge. When a distinction is made between desire and love as two states of appetite, it seems to be based on their difference in tendency. As indicated in the chapter of DESIRE, the tendency of desire is acquisitive. The object of desire is a good to be possessed, and the drive of desire continues until, with possession, it is satisfied. Love equated with desire does not differ from any other hunger.

But there seems to be another tendency which impels one not to possess the object loved, but to benefit it. The lover wishes the well-being of the beloved, and reflexively wishes himself well through being united with the object of his love. Where desire devoid of love is selfish in the sense of one's seeking goods or

pleasures for oneself without any regard for the good of the other, be it thing or person, love seeks to give rather than to get, or to get only as the result of giving. Whereas nothing short of physical possession satisfies desire, love can be satisfied in the contemplation of its object's beauty or goodness. It has more affinity with knowledge than with action, though it goes beyond knowledge in its wish to act for the good of the beloved, as well as in its wish to be loved in return.

Those who distinguish love and desire in such terms usually repeat the distinction in differentiating kinds of love. The difference between sexual love and the love which is pure friendship, for example, is said to rest on the predominance of selfish desires in the one and the predominance of altruistic motives in the other. Sexual love is sometimes called the "love of desire" to signify that it is a love born of desire; whereas in friendship love is thought to precede desire and to determine its wishes.

In contrast to the love of desire, the love of friendship makes few demands. "In true friendship, wherein I am perfect," Montaigne declares, "I more give myself to my friend, than I endeavor to attract him to me. I am not only better pleased in doing him service than if he conferred a benefit upon me, but, moreover, had rather he should do himself good than me; and he most obliges me when he does so; and if absence be either more pleasant or convenient for him, 'tis also more acceptable to me than his presence."

These two loves appear in most of the great analyses of love, though under different names: concupiscent love and fraternal love; the friendship base on pleasure or utility and the friendship based on virtue; animal and human love; sexuality and tenderness. Sometimes they

are assigned to different faculties: the love of desire to the sensitive appetite or the sphere of instinct and emotion; the love of friendship to the will or faculty of intellectual desire, capable of what Spinoza calls the *amor intellectualis Dei*—"the intellectual love of God." Sometimes the two kinds of love are thought able to exist in complete separation from one another as well as in varying degrees of mixture, as in romantic and conjugal love; and sometimes the erotic or sexual component is thought to be present to some degree in all love. Though he asserts this, Freud does not hold the converse, that sexuality is always accompanied by the tenderness which characterizes human love. The opposite positions here seem to be correlated with opposed views of the relation of man to other animals, or with opposed theories of human nature, especially in regard to the relation of instinct and reason, the senses and the intellect, the emotions and the will.

As suggested above, romantic love is usually conceived as involving both possessive and altruistic motives, the latter magnified by what its critics regard as an exaggerated idealization of the beloved. The theological virtue of charity, on the other hand, is purely a love of friendship, its purity made perfect by its supernatural foundation. One of the great issues here is whether the romantic is compatible with the Christian conception of love, whether the adoration accorded a beloved human being does not amount to deification—as much a violation of the precepts of charity as the pride of unbounded self-love. Which view is taken affects the conception of conjugal love and the relation of love in courtship to love in marriage. These matters and, in general, the forms of love in the domestic community are discussed in the chapter on FAMILY.

OUTLINE OF TOPICS

	PAGE
1. The nature of love	1060
1a. Conceptions of love and hate: as passions and as acts of will	
1b. Love and hate in relation to each other and in relation to pleasure and pain	1061
1c. The distinction between love and desire: the generous and acquisitive aims	
1d. The objects of love: the good, the true, the beautiful; God, man, things	1062

1e. The intensity and power of love: its increase or decrease; its constructive or destructive force	1063
1f. The power of hate	1064
2. The kinds of love	
2a. Lustful, sexual, or selfish love: concupiscent love	
(1) The sexual instinct: its relation to other instincts	1065
(2) Infantile sexuality: polymorphous perversity	1066
(3) Object-fixations, identifications, and transferences: sublimation	
(4) The perversion, degradation, or pathology of love: infantile and adult love	
2b. Friendly, tender, or altruistic love: fraternal love	
(1) The relation between love and friendship	1067
(2) Self-love in relation to the love of others	
(3) The types of friendship: friendships based on utility, pleasure, or virtue	1068
(4) Patterns of love and friendship in the family	1069
2c. Romantic, chivalric, and courtly love: the idealization and supremacy of the beloved	1070
2d. Conjugal love: its sexual, fraternal, and romantic components	1071
3. The morality of love	1072
3a. Friendship and love in relation to virtue and happiness	
3b. The demands of love and the restraints of virtue: moderation in love; the order of loves	1073
3c. The conflict of love and duty: the difference between the loyalties of love and the obligations of justice	
3d. The heroism of friendship and the sacrifices of love	1074
4. The social or political force of love, sympathy, or friendship	
4a. Love between equals and unequals, like and unlike: the fraternity of citizenship	1075
4b. The dependence of the state on friendship and patriotism: comparison of love and justice in relation to the common good	1076
4c. The brotherhood of man and the world community	
5. Divine love	1077
5a. God as the primary object of love	
(1) Man's love of God in this life: respect for the moral law	
(2) Beatitude as the fruition of love	1078
5b. Charity, or supernatural love, compared with natural love	
(1) The precepts of charity: the law of love	
(2) The theological virtue of charity: its relation to the other virtues	1079
5c. God's love of Himself and of creatures	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.
